INDEX TO VOLUME LVI.

Illustrated Articles Indicated by *

A.

A, B, C's, by Carolyn Wells, Nov 16, p 39
Abner Acetylene Gas Company, Aug 24, p 51
Accredited manufacturers of plumbers' brass work, Official list of, Oct 19, p 54
Acetylene:
  Acetylene gas abroad, Nov 9, p 50
  Hydrogen in acetylene, Nov 2, p 54
  Value of acetylene, Sep 7, p 52
Acetylene apparatus:
  The freezing of, Nov 9, p 53
  Trouble with, Oct 26, p 60
Acetylene generators:
  Abner, Aug 24, p 51
  Drake special, July 27, p 46*
  Hendler portable, July 20, p 40*
  New Swedish, Nov 23, p 45
  Selling generators, July 20, p 41
Acetylene stoves and their application. July 6, p 31
Address in correspondence, Nov 23, p 53
Adler, H., Company, Aug 17, p 41; 24, p 47; 31, p 43; Sep 7, p 42
Advertising:
  Fifty furnace "Ads," Aug 24, p 43
  Guessing contest, Aug 24, p 49
  Novel dodge, Oct 12, p 67
  Success in, Oct 5, p 38
  Unique dodger, Aug 17, p 44*
  (See also Window displays.)
Aeolipyle Combustion Company, Oct 5, p 40
Aerial navigation, July 27, p 35
Agricultural prosperity, Nov 23, p 34
Ahrens & Ott Works, fire, Sep 7, p 46
Air valves:
  Royal 1900, Aug 3, p 45*
  Vacuum heating systems valve, July 6, p 39*
Air washer and purifier, Thomas Acme, July 6, p 38*
Akers & Harpham, Nov 2, p 56
Alan Wood Company, Nov 9, p 57
Alcohol, Action upon metals, Aug 3, p 49
Alcohol consuming apparatus, Exposition in Paris, Oct 19, p 43
Allegheny Steel & Iron Company, July 13, p 52
Allen automatic air and vacuum valve, Oct 5, p 47*
Allis-Andrew tin plate process, Nov 30, p 45
Aluminum:
  Discovery in California, Oct 12, p 59
  Scrap aluminum, Oct 19, p 67
  Solders for, Sep 7, p 48
Aluminum alloy, A new, Nov 16, p 63
Aluminum Association, International, Sep 28, p 68
Aluminum furniture, Aug 24, p 56
Aluminum kitchen utensils, Oct 26, p 48*
Aluminum patent decision, Nov 2, p 47
Ambler, C. G. Short methods in figures, Aug 24, p 48
American Aluminum Association, Oct 19, p 47
American Electrical Heater Company, Oct 26, p 47
American exhibition in London, Nov 30, p 42
American Hardware Manufacturers' Association, Oct 19, p 44
American Radiator Company, Sep 21, p 52; 28, p 56; Oct 19, p 54
  Boiler plant at Buffalo, Nov 9, p 49
American Sheet Steel Company. (See Strikes, Sheet mill.)
American Society of Heating and Ventilating Engineers, July 20, p 33; Oct 5, p 47
American Tin Plate Company:
  Changes, Oct 26, p 54; Nov 2, p 55
  Manufacture of black plate, Nov 30, p 29
  Strikers and the company, Oct 5, p 56
Andirons, Ornamental, Aug 31, p 43*
Angles of special elbows, Pattern for, Sep 28, p 63*
Ants, Red pepper for, Sep 14, p 62; Oct 5, p 58
Apple corer pattern, Dec 21, p 43*
Apple cutter and corer, Aug 17, p 45*
Arkansas Retail Hardware Dealers' Association, July 6, p 35
Art Stove Company, July 13, p 40
Artistic Enameling Works, Oct 5, p 43
Asbestos air cell coverings, Gast, Nov 16, p 48
Asbestos sad iron, Oct 12, p 50*
Asphalt cement and rust, Nov 2, p 58
Atlantic Coast Master Plumbers' Association, Dec 14, p 43
Atlas Glass & Metal Company, Nov 23, p 46
Australasian National Association of Master Plumbers, Oct 12, p 52
Australian plumbing trade, Competition in, Dec 7, p 42
Australian tariff, Nov 16, p 37
Austria, Industrial crisis in, Nov 23, p 52
Austrian commercial expedition, July 6, p 30
Automatic Wringer Company, Dec 14, p 35

B.

Bacteria, Freezing out, Oct 19, p 53
Bagging live gas mains, Nov 23, p 45
Bailey patent pipe couplings, Oct 19, p 52*
Baker, M. N. The water meter as a sanitary agent, Nov 9, p 49
Baltimore Master Plumbers' Association, Nov 23, p 44
Barbour, E. S., Marriage of, Oct 26, p 43
Barbour Hardware Company, Keeping track of jobs, Aug 31, p 53
Baron de Hirsch Trade School, July 20, p 46
Barrus apparatus for testing steam pipe coverings, Dec. 14, p 44
Bartlett, J. C., Company, Aug 3, p 37
Bath, Advantages of the spray, Nov 9, p 50
Bathroom specialties, Oct 12, p 52; 26, p 47, 51
Bathtubs, Enameled, The situation of, Aug 31, p 48
Bayles, J. C. A challenge of scientific axioms, Dec 28, p 36
Beaton & Corbin Mfg. Company, Sep 14, p 55
Beckwith, P. D., Sep 14, p 51
Behrer & Co., New York, Oct 12, p 52
Benedict & Burnham Mfg. Company, July 13, p 53
Bergstrom Bros. & Co., Aug 17, p 42
Besly polishing machine, Nov 2, p 47*; 9, 48*
Best Street Light Company, Aug 31, p 44
Bibb, B. C., Company, Sep 21, p 45
Bickelhaupt Skylight Works, Aug 24, p 58
Bicycle emery grinder, Oct 19, p 62*
Blast furnace statistics, July 13, p 38
Bliss, E. W., & Co., Oct 5, p 55; 12, p 60
Blue prints, Water proof, Sep 21, p 62
Boal, Stanhope, Loving cup for, July 13, p 39*
  p 39*
Boats, Sheet metal, Aug 10, p 54
  Two-piece sheet metal, Dec. 14, p 37*; 28, p 48
Boiler connections:
  Boiler in bathroom over kitchen, Sep 14, p 62*
  Connecting under difficulties, July 13, p 56*
  Door between range and boiler, Aug 17, p 56*
  Questions, Sep 28, p 63*
Boiler difficulties:
  "Fault of the boiler," Nov 9, p 51
  "It's striking, but is it art?" Nov 9, p 52
Boiler manufacturers affiliate, Oct 26, p 51
Boiler trade, Aug 17, p 46; Nov 16, p 49; Dec 14, p 29
Boilers:
  Champion hot water, Aug 10, p 49
  Comfort, Aug 10, p 48*
  Demarest, Dec 21, p 28
  European heating boilers, Nov 23, p 33, 40*; Dec 7, p 38*; 21, p 36*
  Gorton, Aug 24, p 51
  Henderson-Thermo, July 6, p 37; 13, p 45*
  Ideal, Sep 21, p 52
  Imico, Aug 10, p 50; 17, p 48*
  Kewanee, Oct 12, p 52
  Magee 019-190, Aug 3, p 46*
  Mueller, Aug 10, p 49*
  Quality of range boilers, July 27, p 43
  Rating of boiler, Dec 28, p 47*
  Removing scale, Nov 16, p 50
  Royal, Aug 31, p 47
  Solvents introduced into boilers, Nov 23, p 44*
  Thatcher, July 13, p 46
  Walker, Oct 5, p 50*
  (See also Furnaces; Water heaters)
Bolt, Brohard expansion, Nov 23, p 52*
Bonney, F. E. Personality and human nature as elements of commercial success, Nov 16, p 42
Bookcase, Sheet metal, Sep 7, p 50*
Book reviews:
  Business Sketches in America, Aug 3, p 37
  Contract and Estimate Record Book for Plumbers, B. H. Jessup, Dec 14, p 45
  Electric Gas Lighting, H. S. Norrie, Dec 21, p 46
  Errors in Science Teaching, C. S. Gager, Dec 24, p 46
  Guide to Bronzing and Enameling, Aug 17, p 40
  Hand Book of Practical Mechanics, C. H. Saunders, Nov 30, p 50
  Hardware Store Business Methods, Aug 31, p 44
  House Chimneys, July 20, p 56
  Merchants' Red Book, Oct 12, p 60
  Plumbers' Manual and Text-Book, Oct 19, p 56
  Ratios of Tin Plate Sizes, Sep 14, p 59
  Roofing, Cornice and Skylight Manual, Sep 28, p 62
Born Steel Range Company, Oct 26, p 42
Boss Washing Machine Company, Oct 26, p 47; Nov 9, p 46
Boynton Furnace Company, Oct 19, p 41
Brass, Brazing to copper, July 20, p 46
Brass goods:
  Farnan, Sep 28, p 55
  Glauber, July 6, p 37
Brass Goods Association, Dec 14, p 44
Brass wire, Curious products in, Nov 10, p 57
Brazing, Oct 19, p 62
British Institution of Heating and Ventilating Engineers, Aug 24, p 52; Nov 23, p 43
Brohard expansion bolt, Nov 23, p 52*
Brooklyn Master Plumbers' Association, July 27, p 47
Brucker, M., Chicago, Aug 31, p 43
Brush, Dustless floor, July 27, p 40*
Bryan vacuum molding machine, Nov 16, p 40
Bryce, G. H. Ventilation and heating of buildings, Oct 19, p 48
Buck's Stove & Range Company, Sep 14, p 52
Buckwalter Stove Company, Oct 12, p 46

Building activity in New York, Oct 5, p 37
Building skyscrapers in London, Nov 30, p 30
Building trade, Sharks in, Oct 19, p 51
Burritt, O. W., & Brother, Aug 24, p 48
Business failures, July 13, p 37
Business methods, Dec 14, p 30
  Bad accounts, July 20, p 38
  Buying carefully, Aug 17, p 40; 31, p 40; Sep 7, p 39; 21, p 41; Nov 23, p 33
  Collection, The art of, Aug 24, p 41; Dec 28, p 42
  Costs of doing business, July 13, p 44; Oct 26, p 37
  Credit sales and collection of accounts, Oct 19, p 46
  Keeping track of shop work, Aug 31, p 53; Dec 21, p 38
  Office rules, Sep 14, p 54
  Short methods in figures, Aug 24, p 48
Business situation:
  Effect of car shortage, Nov 9, p 38; 30, p 29; Dec 28, p 27
  Labor fully employed, Nov 2, p 36
  Opening of fall trade, Sep 7, p 37
  Promising outlook, Sep 28, p 45
  (See also Prices)
Butler leather fillet, Nov 2, p 54*
Buying close, Nov 23, p 33
Buying for plumbers and metal workers, Aug 17, p 40; 31, p 40; Sep 7, p 39; 21, p 41

C.

Calcium carbide in Germany, Aug 24, p 51
California, A voice from, Sep 28, p 50
Cameron & Parks, Philadelphia, Oct 19, p 45
Camp stove, Folding, Aug 3, p 39*
Canada:
  Effect of steel strike, Aug 24, p 57
  Higher commercial education, Oct 12, p 44
  Trade with Canada, Dec 7, p 37
Canadian National Association of Master Plumbers and Steam Fitters, July 6, p 37
Canning Machinery Company, July 20, p 47
Cans, Milk, Proportions for, Nov 30, p 47
Car shortage, Effect on business, Nov 9, p 38; 30, p 29; Dec 28, p 27
Carnahan Stamping & Can Company, July 20, p 47
Carnegie technical school, July 6, p 30
Carnegie Tube Company, Dec 14, p 43
Carpenter, R. C. Tests of radiators with superheated steam, July 20, p 41
Case hardening metals, Oct 19, p 62
Cast iron soil pipe situation, Nov 30, p 39
Cast iron pipes, Life of, Dec 7, p 41
Caster, X L C R ball bearing, Sep 28, p 61*
Caterer, Automatic, Oct 5, p 53
Cellar, Water tight, Aug 24, p 61; 31, p 56
Cement, Uses of, July 20, p 46
Central Foundry Company, Changes, Nov 23, p 46
Central Stamping Company, Aug 3, p 43
Central station heating, Sep 7, p 45; Oct 19, p 39; Nov 2, p 35
Central Supply Association, Nov 2, p 50
Challenge of scientific axioms, Dec 28, p 36
Challenge Refrigerator Company, Dec 14, p 35
Champion Steel Range Company, Sep 14, p 50
Chapter house, Heating a, Nov 9, p 39*
Charleston Exposition, Dec 7, p 27
Check and voucher combined, Oct 12, p 48
Cheese hoops, Sturgis seamless, Aug 3, p 42*
Chicago Retail Hardware Dealers' Association, July 27, p 40; Dec 7, p 31
Chicago Stove Works, Aug 3, p 39
Chicago Tin Plate & Can Company, July 20, p 47
Child, E. T. Hot water heating, Nov 2, p 48
Chimney and fire place construction, Sep 7, p 42
Chimney base, Floyd, Wells & Co., Sep 7, p 43*
Chimneys:
  Back draft from chimney, Nov 16, p 59*
  Chimney does not draw, Nov 9, p 60*
  Improper construction, Nov 23, p 48
  Tops and ventilators, Nov 30, p 42
  Ventilators for back draft, Nov 23, p 56; Dec 7, p 48
Christmas carol, Dec 28, p 32
Christmas in the stove and tin shop, Dec 7, p 32
Church furnace, Constructing a, Nov 2, p 59*; 9, p 59; 16, p 59; 23, p 55
Clapp, Chester D., Sales and collections, Oct 19, p 46
Clark, G. M., & Co., Aug 3, p 40; 24, p 52
  Buffalo exhibit, Aug 17, p 42*
Clayton & Lambert Mfg. Company, Sep 21, p 52; Oct 19, p 51
Clevelaud and Chicago resolutions, Nov 16, p 35, 45
Cleveland Window Glass Company, Aug 3, p 44
Climax Nut, Lock & Mfg. Company, Aug 17, p 47
Clothes line holder, Nov 2, p 57*
Coal:
  Demand for American, in Europe, Dec 7, p 28
  Production of 1900, July 13, p 38; Aug 10, p 59
  Soft coal for domestic use, Dec 28, p 29
Coal hod, Novelty, Nov 30, p 34*
Coating terne plates, Nov 16, p 55
Coating tin plates, Machine for, July 20, p 48
Coe Brass Company's purchase, Aug 3, p 49
Coil in furnace, July 13, p 54*
Coils in stoves, Use of, July 20, p 41
Collection, The art of, Dec 28, p 42
Colors, Sources of, Sep 21, p 62
Commerce, School of, in New York, Dec 21, p 27
Compulsory arbitratiou in New Zealand, Nov 9, p 37
Confederated Supply Associations, National Committee, Oct 5, p 50; 26, p 49; Nov 16, 35, 45
Connecticut Association of Master Plumbers, July 20, p 43
Cooling and warming of closed air spaces, Dec 28, p 38
Consolidations, Difficulties of, Sep 21, p 41
Contracts with time limits, Oct 5, p 38
Co-operative Foundry Company, July 20, p 36
Copper:
  Adulteration of sheet, Dec 28, p 48
  Welding, July 6, p 46
Copper situation, Oct 5, p 37; Nov 16, p 35
Coruice maker, What he should know, Dec 14, p 40; 21, p 42; 28, p 43
Correspondeuce, Form of address in, Nov 23, p 53
Corrugated galvanized irou and steel duty, Nov 9, p 64
Cost of living, Higher, Nov 16, p 36
Costs of doing business, July 13, p 44; Oct 26, p 37
County fair exhibits, Sep 28, p 47
Cover for wash boiler, Pattern for, Dec 28, p 44*
Cowl, Ship ventilating, Aug 17, p 51*
Crane Company, New York, Sep 28, p 55
Credit sales and collection of accounts, Oct 19, p 46
Cribben & Sextou Company, Sep 14, p 51
Crude oil portable heating furnace, Nov 2, p 46*
Crude oil or tar burner, Sep 14, p 57*

D.

Damper regulator, Morgan, Aug 31, p 47*
Danville Stove & Mfg. Company, Sep 7, p 43
Danzer's Lightning edger, Dec 14, p 39*
Day Metallic Mfg. Company, Oct 12, p 57
Dayton Stove Repair Works, Oct 26, p 43
Defiance grinding and polishing machine, Nov 23, p 53*
Detroit Stove Works, Aug 24, p 45*; Sep 28, p 50
Diamond Stamped Ware Company, Oct 26, p 52
Dietz, R. E., Company, Oct 19, p 47
Dimensions for plumbers, Aug 31, p 46
Discounts, A question of, Sep 14, p 48
Distribution of goods, Economical, Oct 12, p 49
Domestic Garbage Burner Company, Aug 3, p 43
Donner process of rolling black plate, Oct 19, p 58
Dover Mfg. Company, Oct 12, p 50
Drake acetylene generator, July 27, p 46*
Drawing board, Details of an upright, Nov 16, p 58*
Drill rack, Handy, Oct 26, p 64*
Drought, The, July 27, p 35
Drying oven, Trouble with, Aug 31, p 55*; Sep 7, p 53; 21, p 57*
Du Bois, F. N., Company, Sep 21, p 52
Dust, Avoiding, in stores, Sep 21, p 47
Dust causes impure air, Nov 30, p 39; Dec 21, p 28
Dwelling houses, Decline of individual, in New York, Dec 28, p 28

E.

Earth closet, Substitute for, Dec 14, p 47
Eccentric fittings and their use, Nov 2, p 51
Eclipse Stove Company, Aug 10, p 45
Economy Stove & Mfg. Company, Oct 26, p 43
Eddy, W. H., Company, Aug 17, p 54
Edger, Danzer's lightning, Dec 14, p 39*
Education:
  Education for plumbers, Oct 19, p 53
  Gifts to, Dec 21, p 27
  Higher commercial, Dec 21, p 27
  Importance of technical, Nov 23, p 34
Edwards Mfg. Company, July 27, p 53
Elbow springing from pipe, Pattern, Oct 26, p 55*
Electric air heater, Oct 26, p 47*
Electric city gutter former, Nov 16, p 57*
Electric effect in a church, Aug 31, p 60
Electric fire hazard, July 6, p 46
Electric heating, Oct 19, p 39
Electric Smelting & Reducing Company *vs.* Pittsburgh Reduction Company, Nov 2, p 47
Electric water heaters, Dec 7, p 41*
Elliptical pipe and scalene cone, Intersection of, Nov 30, p 44*
Emmert Mfg. Company, Aug 24, p 50
Enameling process, New, Sep 7, p 49
English plumbers' guild, Ancient, Oct 19, p 52
Enterprise Mfg. Company, July 6, p 36; Oct 19, p 41
Export trade:
  Export houses and the cultivation of foreigu trade, Nov 2, p 35; 9, p 37; 23, p 34
  Manufactures, July 27, p 35
  Packiug goods, Aug 10, p 37
  Studying foreign business methods, Dec 7, p 27
  Tin plate, Aug 3, p 50
  United States, Oct 26, p 54

F.

Failures iu business, July 13, p 37
Fall trade, Openiug of, Sep 7, p 37
Farnan Brass Works, Sep 28, p 55
Federal Boiler & Supply Company, Dec 14, p 43
Figures, Short methods in, Aug 24, p 48
Fillet, Butler leather, Nov 2, p 54*
Filter for a cistern, July 20, p 51; Aug 17, p 55*
Fire hazards of heating systems, Sep 21, p 53
Fire losses, July 13, p 37

Fire proof buildlng material, Tests of, Sep 7, p 38
Fire proof construction, Test in Chicago, Nov 9, p 48
Flanges, Standardization of extra heavy, Oct 12, p 54
Fletcher, Russell & Co., Warrington, England, Nov 9, p 43
Float, Detroit Stove Works, Aug 24, p 45*
Floor plate, Beaton & Corbin, Sep 14, p 55*
Floyd, Wells & Co., Aug 31, p 43; Sep 7, p 43
Fluted bottom of circular bay, Patterns for, Nov 23, p 54*
Folsom, C. G. Hot air furnace heating, July 27, p 44*
Foreign trade. (See Export trade.)
Fork pattern, Oct 5, p 54*
Fowler Radiator & Mfg. Company, Aug 17, p 46; 31, p 46
France:
  Plumbing and sanitary appliances, Oct 19, p 50
  Settlement of labor disputes, Nov 9, p 44
Freight car shortage, Nov 9, p 38; 30, p 29; Dec. 28, p 27
Freight charges and back orders, Aug 31, p 39
Fresh air duct, Construction of, Dec 7, p 47*
Frost on windows, Dec 7, p 47*; 14, p 46*
Fruit picker, Eclipse, July 13, p 42*
Fuel economizers, Oct 5, p 45
Funnel and spout pattern, Dec 7, p 36*
Furnace casings and piping, Aug 24, p 43
Furnace difficulties:
  Popular ignorance, Nov 16, p 38
  Small flues hinder heating, July 13, p 55*; 20, p 51; Aug 13, p 53
Furnace heating. Hot air, July 27, p 44*
Furnace pipes. Discrepancy in proportioning. Dec 14, p 32
Furnace trade, Increasing, July 27, p 38
Furnace work:
  Better, Oct 26, p 41
  Calculations for, Dec 21, p 30
  Hard knots in furnace practice, Dec 28, p 30
Furnaces:
  Beacon Sunshine, Nov 30, p 34
  Boynton, Oct 19, p 41
  Brien heater, July 13, p 40*
  Chappell hot air, Nov 9, p 42
  Constructing a church furnace, Nov 2, p 59*; 9, p 59; 16, p 59; 23, p 55
  Crude oil heating furnace, Nov 2, p 46*
  Etna hot air, Aug 10, p 39
  European warm air furnaces, Nov 2, p 36, 38*
  Favorite, Nov 9, p 43
  Forbes, Aug 24, p 44
  Gas furnaees, Aug 3, p 37; Oct 19, p 41*
  Hustler, Oct 26, p 45*
  Installing furnace plants in old houses, Oct 5, p 41*
  Jahant hot blast, July 20, p 36
  Monitor, July 6, p 32
  Mueller, Aug 24, p 43; Nov 9, p 53
  Natural gas, Aug 3, p 37; 10, p 40*; 24, p 47*
  Robinson, July 13, p 41
  Thatcher, Oct 12, p 46
  Tropic Sunshine, Nov 30, p 34
  Ventilation problems, Dec 28, p 30
  Welcome, Sep 14, p 49
  (See also Boilers: Water heaters.)

G.

Galesburg Cornice Works, Aug 10, p 53
Galvanized tank, Crating for, July 13, p 55; 20, p 51; 27, p 55
Galusha Stove Company, Aug 3, p 39
Galvanized iron, Coating for, Dec 14, p 47
Galvanized ware in Great Britain, Aug 3, p 42*
Gara, McGinley & Co., Philadelphia, roofers, Oct 26, p 57
Garbage briquette fuel, Oct 5, p 57
Garbage burner, Domestic, Aug 3, p 43
Garbage cans, Best-of-all, Aug 3, p 43*
Garbage receptacle, Portable pivoted, Oct 19, p 45*
Gas:
  Mond gas in Great Britain, July 6, p 52
  Production from air, Nov 23, p 52
  Production from gasoline, Nov 30, p 47
Gas by pass for window lighting, Sep 7, p 45*
Gas fields of the West and Texas, Aug 10, p 54
Gas furnaces:
  Pennsylvania, Aug 3, p 37
  Thompson, Oct 19, p 41*
Gas mains, Bagging live, Nov 23, p 45
Gas meter connections, Novelty, Aug 24, p 51*
Gas radiator, Acme, Sep 7, p 42*
Gas stove trade, July 27, p 38; Oct 26, p 44
Gas stoves:
  Acme, Aug 17, p 41
  Fire King, Oct 5, p 44*
  Jewel, Aug 3, p 40
  Monarch, Sep 14, p 50
  Monogram, Aug 31, p 43*
  Odin, Dec 7, p 30
  Profitable distribution of, Nov 30, p 33

STOVE LININGS

McLEOD & HENRY CO.,

TROY, N. Y.

Gray Iron Castings. S. CHENEY & SON, Manlius, N. Y.

We have just completed two sizes of a laundry stove that will really heat irons and heat water at the same time. The No. 2 has a 12-inch firepot, will heat ten eight-pound irons and will also heat 65 gallons of water per hour. The firepot is surrounded by water and the iron heating section is immediately over the fire. This stove is away in advance of anything of the kind that has yet been offered to the trade, and the price is low.

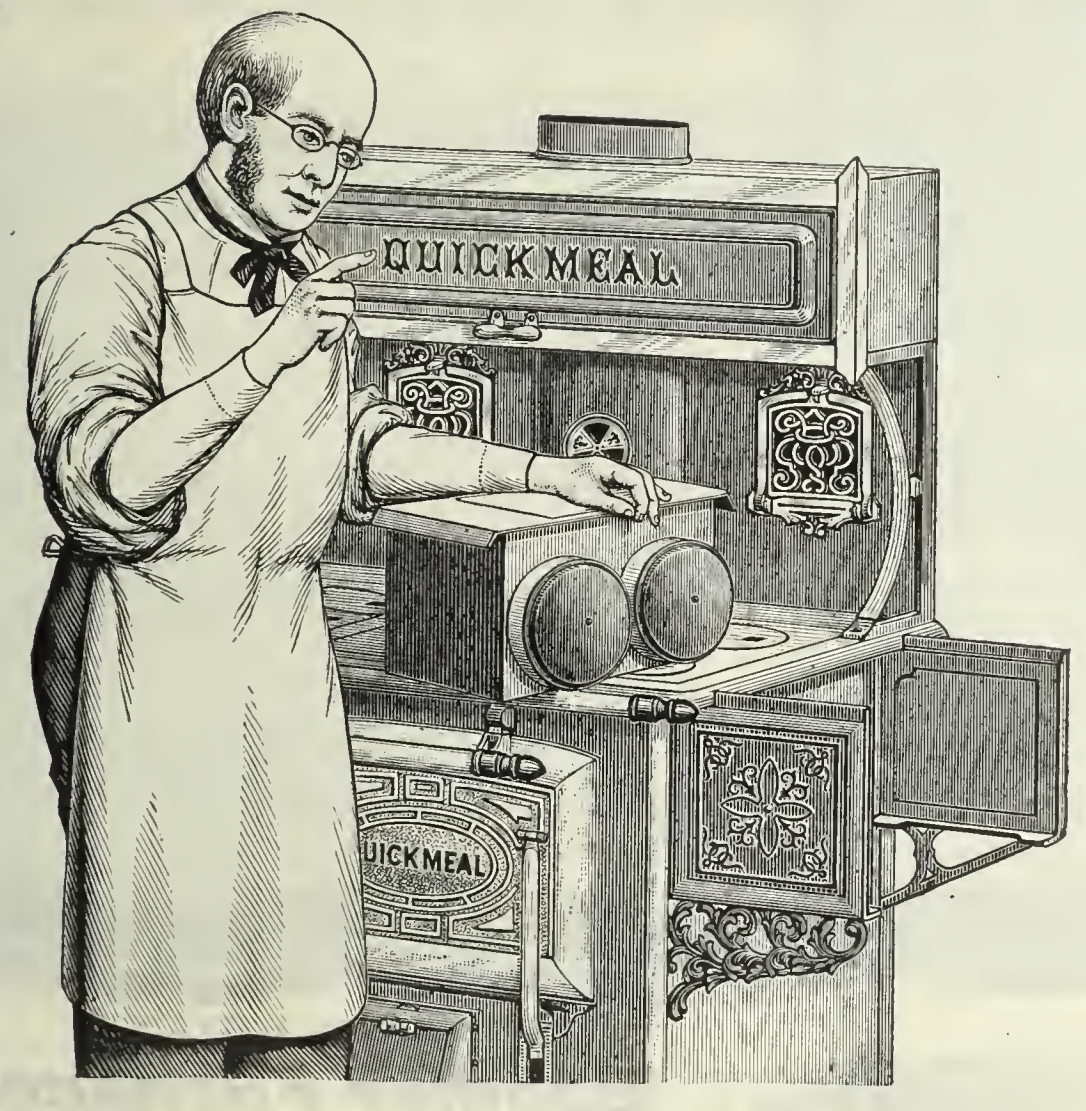
QUICK MEAL



The practical old-time Tinner says:

A SIMPLER, MORE PERFCT or BETTER FITTING RESERVOIR could not be made than the

New "Quick Meal" Right-Hand Reservoir.

It is SIMPLE, DURABLE and PRACTICAL. **Nothing else like it on the market.** No dampers to interfere with the draft or confuse the operator. The outside casing is ornamental and so arranged as to allow the air to circulate between the casing and the Reservoir, preventing sweat and steam from draining down the Reservoir sides.

"Quick Meal" Reservoirs are made of Copper, its pockets being drawn out of one piece of extra heavy copper, double seamed to the body and covered on the fire ends with a piece of heavy sheet steel to protect the copper from the extreme heat. When the Reservoir is in place the pockets project through the right wall of the Range and fit flush on the inside, making no obstruction in the flue and allowing the heat to come in direct contact. They are as good as the "Quick Meal" Left-Hand Reservoir—they could not be BETTER—but they are better than any right-hand reservoir ever made.

THE RICHMOND

Steam and Hot Water

BOILERS

keep up their good work, giving more heat with less coal than any other heater made. Powerful, economical, durable. Quick to set up, quick to clean.

A Catalogue sent for the asking.

THE RICHMOND STOVE CO., - **Norwich, Conn.**

Model Steel Range

For Hard Coal, Soft Coal or Wood.

They are **Models** of all the good things, useful and beautiful, that can be embodied in a modern range. Their popularity, on account of their many good points, has led many imitators to copy them as near as they dare, but as the oven doors, dampers, fire-box and other features are covered by patents, the imitations are still behind in the race, so far as construction and operation are concerned, and we feel confident that a comparison will result in a most favorable impression as to our claim that they are **Models of Beauty** and just the one range above all others that it will pay the dealer to handle. The large and constantly growing trade we enjoy on the **Model Steel Range** has been built up purely on its merits and not through a lot of extravagant "fake" advertising.

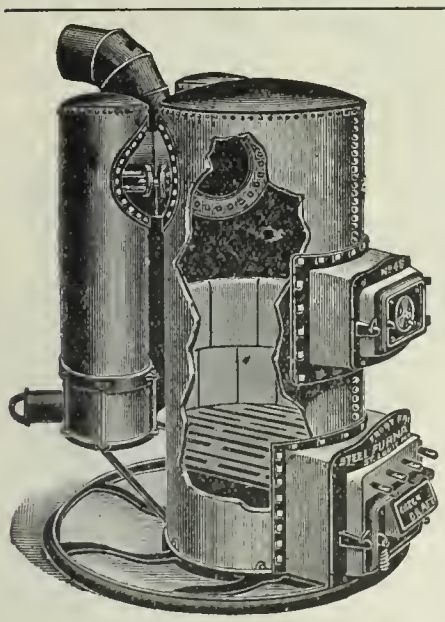
DON'T

handicap yourself in the stern competitive struggle after business by handling an inferior range or furnace. You can't afford to pursue such a course or you will find yourself in the rear division of the procession. The way to get to the front in the furnace and range trade in your town is to handle recognized leaders like SCHILL FURNACES and RANGES. The company making these ranges has a larger capitalization and greater facilities than ever before, and these goods are to be even more widely known in the future than they have been in the past.

Write us for catalogue and discounts.

THE SCHILL BROS. CO.,
CRESTLINE, O.



Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

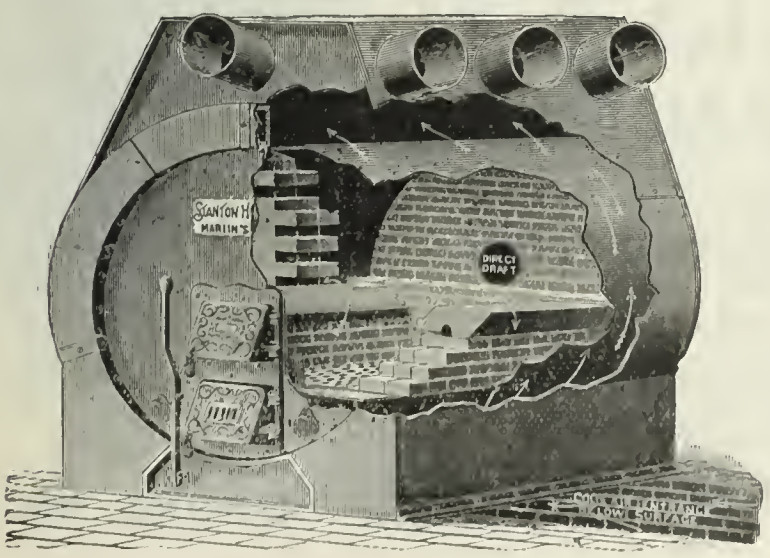
The Stanton Seamless Heater,

PORTABLE CASED.



LOUISVILLE, KY., Apl. 5th, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly,

A TWENTY inch pot **"DIGHTON"** Furnace has a radiator 30 inches in diameter, 27 inches high.

The indirect flue plates extend from either side of feed door around to smoke outlet.

Nine-tenths of all surface is ***Bright, Direct Heating Surface.***

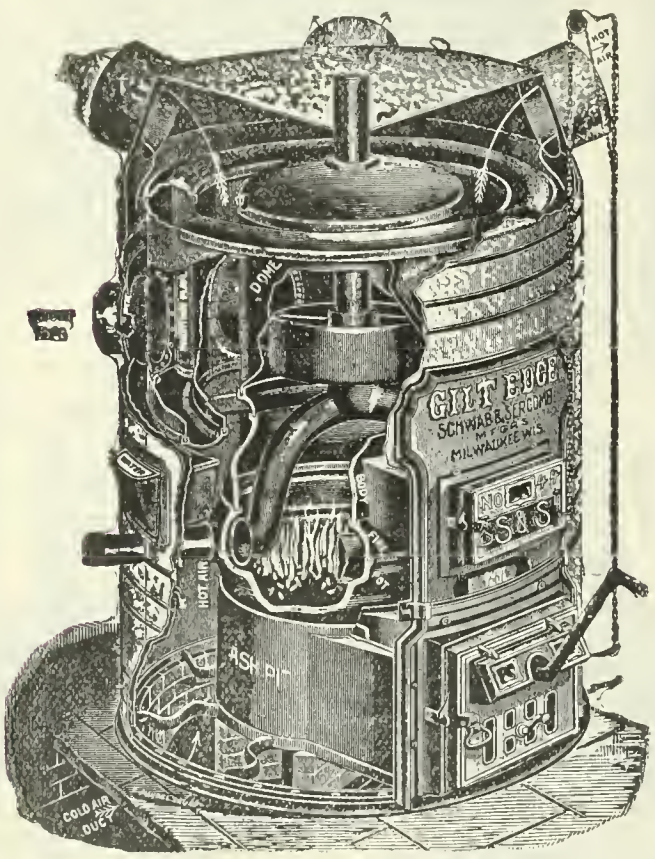
This is only one of many good reasons ***why*** a "DIGHTON" does more heating with less fuel than other Furnaces.

Test a "**DIGHTON**" somewhere that you can ***compare results*** with some other Furnace, no matter if the other radiator has an acre of dark indirect flue surface.

Some dealers now make a regular practice of figuring a 20 inch pot "**DIGHTON**" where their competitors figure some other 22 inch pot Furnace.

They could not afford to run chances doing so if they had not already proved the capacity of the "**DIGHTON.**"

DIGHTON FURNACE CO., TAUNTON, MASS.



UTILIZED radiating surface, that is economy Sectional fire pots from 1 in. to 2 in. thick and other parts in proportion, that is durability. Positive gas-tight joints, that is necessary to health. These, with all other improvements for ease of management, are combined in the Gilt Edge Furnaces. They are made for all kinds of fuel, and are the very best.

PERSISTENCY.

It was Josh Billings who declared that "if a man saved only a cent a year, it was merely a question of time when he would become a millionaire." You may smile at the remark, but at the same time you must recognize the element of persistency which it contains.

Now that same element is behind every effort made in behalf of

GURNEY HEATERS

"Bright Idea," "400 Series" and "Doric."

It was persistency that made their present excellence possible. It was persistency that secured their present recognition. It shall be persistency which will broaden their already extensive success.

We've a lot of good agents now, but we want more. Better become our agent right away so that these advantages may bring money into your cash drawer.

Our latest trade catalogue, which we will gladly send as soon as you ask for it, contains the whole story. Your address please?

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The ***American Furnace*** is made for the better class of trade; is durable, clean and economical in fuel.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

Sent postpaid on receipt of price, $1.50.

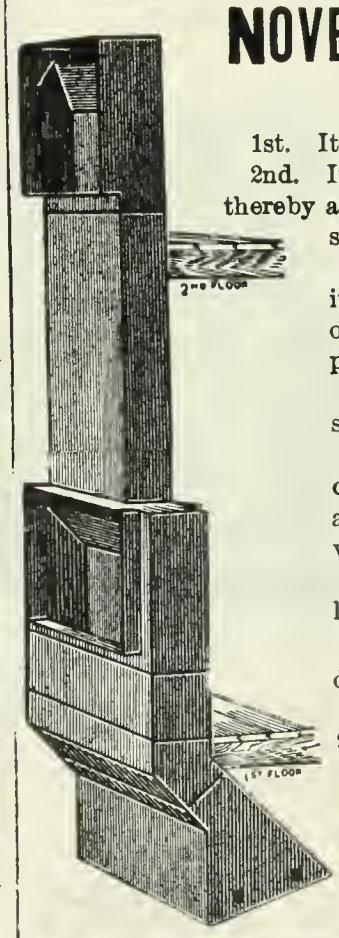
The G. S. BLODGETT CO., Burlington, Vt., U. S. A.



NOVELTY VENTILATED WALL PIPE.

SPECIAL ADVANTAGES:

1st. It is absolutely fire-proof.

2nd. It is made in lengths from one inch to 8 feet in one piece, thereby avoiding loss of time putting together a large number of short pieces to run a stack to second or third floor.

3rd. If a run of pipe is found to be longer than required it only takes a few moments to remove the socket end, cut off what is required and replace the socket, leaving the joint perfect.

4th. The slip connection is fully ½ inch long and when slipped together makes a perfectly tight joint.

5th. The right angle elbows are made with an easy curve on the back and a sharp curve on the inside, which allows getting around a corner without coming in contact with plaster at ceiling.

6th. It is ventilated the entire length, which is an absolute guarantee against fire.

We also make single wall pipe of same dimensions as double.

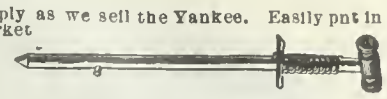
The YANKEE Hot Air DAMPER (Improved All Steel.)

THE YANKEE EXCELS.

Above All—Cheapness—a dealer cannot possibly make dampers as cheaply as we sell the Yankee. Easily put in and taken out of pipes. Stiffest, quickest-working and neatest damper on the market

ROD POINTS: Has wood enameled handle. Wood handle cannot come off. Washer and spring cannot fall off the rod. Same size of holes are punched on each side of pipe. Rod is made of ¼ inch cold-rolled steel and slips into damper very smoothly. **Sample sent to any Dealer without charge.**



It is impossible for this rod, when in position, to move either way.

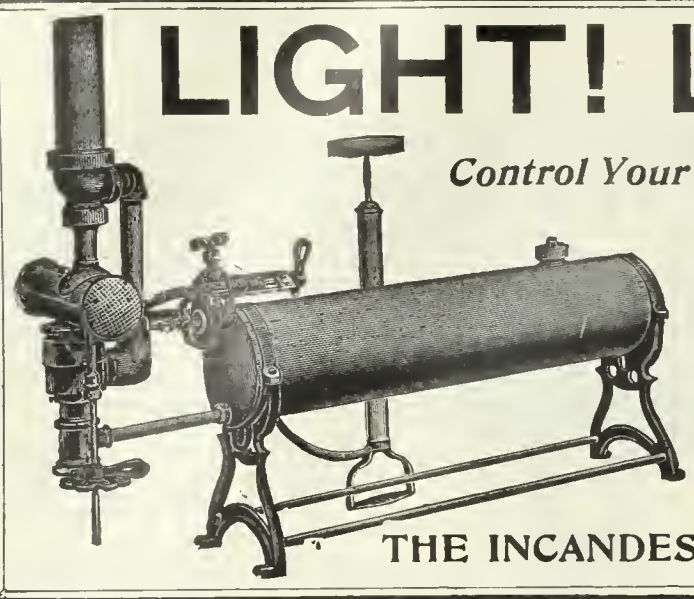
LIGHT! LIGHT!

THE CHEAPEST AND BEST IS

THE AIR LIGHT

Control Your Own Gas Expense.



A radical departure from methods heretofore attempted in illumination. Extreme cheapness and great brilliancy of light, simplicity of operation and durability is the result. As a commercial light it is the crowning triumph of lighting apparatus, costs less than one-half that of gas light or electricity, requires less attention than one ordinary oil lamp. Gives 600 candle power at one-half a cent per hour and is absolutely safe. Thousands of these machines are in daily use and giving perfect satisfaction. Size of average apparatus, 33 x 12 x 12. Any Tinner can put it up. Write for descriptive pamphlet and prices.

MANUFACTURED BY

THE INCANDESCENT LIGHT & STOVE CO., 422 and 424 E. Pearl St., Cincinnati, O., U. S. A.

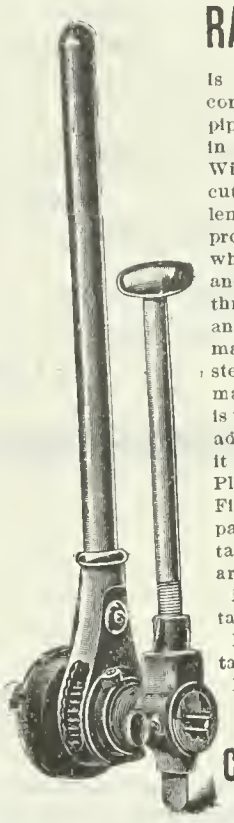
LEAD LINED IRON PIPE.

The Climax RATCHET STOCK



Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe. takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe. takes 2½, 3 and 4 in. die, $17.00.

For sale by leading jobbers.

Manufactured Solely by

The Sheet Mill Strike

The strike of the sheet mill workers, which went into effect this week by order of the officials of the Amalgamated Association of Iron, Steel and Tin Workers, may or may not develop into one of the greatest labor struggles of recent years. About 20,000 men are at present affected, but it is freely whispered that the ultimate aim of President Shaffer and the Amalgamated Association leaders is to involve in the strike all the workers in the varied branches of the iron and steel industry, which are more or less controlled by the United States Steel Corporation. The question which has brought about the present strike is not one of wages or of hours of labor, the two main causes of labor troubles in the past. As a matter of fact, the men who are now on strike have been receiving, and would continue to receive, the highest wages ever paid in their branch of labor, while their conditions are vastly more favorable than those enjoyed by their fellow workmen in any part of the globe. Nevertheless, they are ordered out for the purpose of forcing the United States Steel Corporation, or rather the American Sheet Steel Company, one of their constituent concerns, to sign the wage scale on a union basis for each one of their works individually. As some of the most important sheet mills have never yet been recognized as union mills, the American Sheet Steel Company positively refuse to alter the present status at the demand of the labor unions. The United States Steel Corporation are quite indifferent as to whether their workmen are or are not members of the Amalgamated Association, but it is too much to expect them to act as organizers for the union.

Tenement House Improvement in New York:

The new tenement house law, which came into operation in New York City on Monday, July 1, contains a number of provisions which are calculated to secure material benefits for those who dwell in the crowded districts of the city. It is stated that there are no less than 82,000 tenements in New York which come under the terms of the new law. Some of its provisions are likely to cause irritation to owners of old tenement house property. For example, a clause provides that each room in old tenement houses must have a window opening to the outer air, or a window opening into an outside room. This will compel owners to put windows into the walls of rooms which are arranged with one front and one back outside window and two dark rooms between. There are over six thousand such tenements in the city. Where there are four dark rooms it will be necessary to put in a light shaft. Another most salutary provision of the law is one requiring owners to supply plenty of water at all hours of the day or night on each floor, and also to supply receptacles for rubbish, garbage and refuse. The sanitary value of these provisions, if they are strictly carried out, will be particularly recognized in such torrid weather as that recently prevailing. Enforcement of the regulations affecting new buildings has already been undertaken by the city Building Department, and the Health Department is responsible for seeing that the rules affecting old buildings are enforced until January 1, 1902, when the new city Tenement House Department of the municipal government created by the charter revision law will come into existence. It is the opinion among those best qualified to know that hundreds of the old houses now used as tenements will have to be abandoned if the new law is strictly enforced. The wiping out of such rookeries as cannot exist under the new law will be a satisfaction to all who have the well being of the city at heart. The owners, who are drawing a substantial revenue from them in their present unsanitary condition, are about the only persons who will regret their disappearance.

At a recent meeting of the Austrian Industrial Union statistics were given to prove that water power was cheaper to use and much cheaper to operate than steam power, and that the general utility of the former was substantially as great as that of the latter. The following test case in the Tyrol was mentioned: A factory was equipped with both water and steam power of exactly the same volume. The water power cost 65 cents per horse-power, and the steam power 73 cents. In the cost of operating, however, the difference was much greater. With water the expense was 0.07 cent per horse-power per hour, while with steam the cost was 0.61 cent. The saving in a year by the use of water at this factory amounted to $203,812, representing approximately a capital of $4,060,000. Water power is a highly important factor for cheapening the cost of manufacturing in the mountain region of Austria. Many streams abound, all of which are utilized in turning the wheels of industry at a small cost. This is the secret of the success of Austrian manufacturers in certain lines in placing their goods in foreign markets at a materially smaller cost than those of other nations.

The growth of the co-operative movement in England has been little less than phenomenal. Fifty-seven years ago 28 men in Rochdale with a capital of $140 began the co-operative distribution of merchandise. The first year their trade was $3550. At the end of last year there were in the United Kingdom 1464 distributing societies, with a membership of nearly 1,750,000, a shared capital of $100,000,000, and a trade of over $250,000,000. About $35,000,000 was returned to the members, amounting to a net economy in the spending power of the consumers' money of about 15 per cent.

United States Consul Hughes of Coburg, Germany, calls the attention of the State Department to a scheme which he says is being advertised extensively in the shape of a machine for turning common peat into so called artificial coal at the rate of $1.10 to $1.20 per ton. The company making this fuel are said to be located somewhere in Eastern Prussia, and the claim is made that this process will make a fuel that will take rank between

a good English coal and anthracite. The statement is advanced that the managers are about to organize a company in the United States, so the Consul believes that it would be well for American investors to exercise caution nntil the real worth of the process has been proved. He has reason to believe that it is valueless.

The aggregate of dividend payments made on July 1 to the bondholders and stockholders of railway, industrial and other corporations is estimated at $53,816,000, this being by far the largest snm ever paid on Jnly 1. The dividend disbnrsements on Jnly 1, 1900, amounted to $38,611,000, which was the largest snm np to that time.

It is announced that a meeting of labor leaders will be held in Chicago on Monday next, Jnly 8, for the purpose of forming a national alliance of trade nnions. President Shaffer and other leaders of the Amalgamated Association of Iron, Steel and Tin Workers are nnderstood to be among the leading spirits in this movement, and it is freely stated that one of the real pnrposes of the alliance is to combine in one organization all the employees of the United States Steel Corporation, including the workers in the mills, blast furnaces, coal and ore mines, docks, and other forms of skilled and nnskilled labor. No small opposition to this movement is making itself felt among the labor unions. It is regarded as an attempt to set np a new organization in opposition to the American Federation of Labor, which aims to cover almost precisely the same ground that the proposed alliance of trades unions expects to occupy. The movement will be watched with considerable interest, as it is likely to exert considerable influence upon the relations between the United States Steel Corporation and the workmen in their various properties.

So desperate is the condition of the farmers in certain parts of the West that it is feared a large portion of the rich fields of wheat may be ruined for want of sufficient labor to harvest them. A curious incident illustrating the stress to which they are put comes from Kansas, where, a few days ago, a party of 20 Osage County farmers held up a west bound Santa Fé train, near Peterson, in order to obtain the necessary help for harvesting their grain. In spite of the active opposition of the train hands they compelled the train to stop and cut loose two emigrant cars containing men bound for further Western points. With the aid of clubs, shotguns and similar forcible arguments, which resulted in serious injnry to several on both sides, the agriculturists finally snceeeded in secnring and marching off to their farms 200 harvesters to work at a wage of $3.50 a day.

The report of the United States Health Commissioner for the city of Havana, covering the year 1900, shows that under the American *régime* the average death rate of that city was reduced from 33.21 per 1000 popnlation to 24.40. Morcover, the returns for the first few months of 1901 have demonstrated that this considerable reduction has been still further bettered to an average death rate of 19.2 per 1000. Yellow fever has been materially checked and the mortality of infants has shown a marked redncticn, owing to the sanitary laws which are enforced by the American military officers in charge of the Health Department. In short, Havana has been transformed in the past two years from a virtnal plagne spot to a city which compares favorably, from a sanitary point of vlew, with the average of civilized centers of population.

The Carnegie Technical School.

The advisory committee appointed by the Board of Trustees of the Carnegie Institnte of Pittsbnrgh, to investigate and prepare a plan for the proposed School of Tochnology to be presented to the city of Pittsburgh by Andrew Carnegie, have handed in a report, which advocates the establishment of three grades of schools. The first will be the Carnegie Technical College, which will provide a technical edncation to high school gradnates, teaching engineering in all its branches. The second, to be called the Carnegie Technical High School, will be for the benefit of gradnates of the grammar schools, and will provide, in addition to the regnlar high school studies, instrnction in blast furnace and foundry practice, brass founding, pattern making, metal working, stationary, locomotive and marine engine and boiler management, gas manufacture, electricity and other departments, more particnlarly adapted to the needs of the Pittsburgh district. The third school will be the Carnegie Artisan Day and Evening Classes. These classes are intended for the benefit of those who are unable to take advantage of the more complete courses in the technical school.

Austrian Commercial Expedition.

United States Consul-General Carl B. Hnrst of Vienna, Austria, sends to the State Department further information regarding the Anstro-Hungarian commercial expedition which is about to be dispatched to Eastern Asia. This expedition, the Consul says, has been very carefully organized and is under the leadership of an Anstrian merchant who has resided many years in the Orient. The exhibition has received no Governmental or other subsidy, but it is undertaken on a business basis calculated to render the enterprise a financial success. This is the second ventnre of the kind that has been made under the same management. The first, to which reference was made in these columns abont two years ago, was a profitable nndertaking, and the present exhibition, improved in eqnipment and traveling further afield, is calculated to bring in substantial retnrns for the promoters, and to open markets for Anstro-Hungarian goods in some places where that country is now nnrepresented. Italy in recent years has tried this scheme to advantage and the Italian Trading Company, organized to exploit Italian products abroad, are now a vigorons and paying body, with a membership of over 500 manufacturers. Germany sent out to the far East, in 1898, a commercial exposition which was absent over a year and achieved gratifying results. Austro-Hnngarian exporters and mannfactnrers desirous of participating in the present expedition are permitted to send samples occupying a space of not more than 36 cubic feet and having a weight of 1 ton, at a cost of $200, and for each further like qnantity $100 is charged.

Outside of a moderate commission on orders reaching the exhibiting manufactnrer directly or indirectly through the medium of the expedition, no further charges are made. The expedition was to start this month, stopping on its way in New York and in San Francisco, and making exhibits in Japan, China, Siam, the Straits Settlements, Sumatra, Burmah, India, Aden, Suez and Port Said. The aim of the directors is to carry samples of Austro-Hungarian mannfactures to exhibit them in suitable places and take orders and to collect samples and price-lists of salable articles abroad, and submit them to manufacturers in Austria interested in such goods. Among the direct advantages that this commercial expedition offers are the assurance that goods will be energetically exploited in a proper manner and the certainty that orders taken on the basis of the exhibited samples will reach the mannfactnrers concerned, and that cash payments will be made npon presentation of the bill of lading by some Enropean bank to be designated at the time. Detailed reports will also be made to the manufacturers of the condition of foreign markets, their demands and requirements, together with snggestions as to Austrian goods liable to sell there, their quality, designs, method of packing, &c., as well as information regarding prices and terms.

W. K. Vanderbilt, Jr., has purchased and is importing into this country a Mercedes make of antomobile built in Germany, which is one of the largest motor vehicles yet constrncted, and is also claimed to be the fastest machine of its kind. The antomobile is of 40 horse-power, and in its tests made a speed of 72 miles an hour. The most peculiar part of the carriage is the dasher, which, instead of running ont in front runs underneath. This arrangement is claimed to give a greater amount of speed.

ACETYLENE STOVES AND THEIR APPLICATION.

BY A. J. MURDOCK, M D., MINNEAPOLIS, MINN.

There has been, and is now, a general impression abroad that acetylene gas cannot be used for cooking purposes. Not only among those who have been actively engaged in promoting acetylene lighting, but the general public as well.

One of the first questions asked by a purchaser of an acetylene lighting plant is, "Can we use this gas for cooking purposes?" The answer has been "No." Some of the earlier experiments were made with ordinary burners used for city gas, with the result at least of shocking the nerves and conveying the impression that acetylene gas was something that could not be safely manipulated. This was largely due to the disastrous results from explosions of compressed gas, and the fear and prejudice created at that time had a deterrent effect on experimenters along these lines.

We began our experiments with acetylene gas for cooking about two years ago, and have continued them uninterruptedly until recently, and we desire to state that of the hundreds of different devices for burners constructed and tested by us, not the slightest accident has resulted to our workmen, nor injury to material used in the experimonts. This was a new field of work. There were no guides, no rules, no precedents, no experiences, of either success or failures. No gas burner ever made previous to this time was adapted to burn acetylene gas satisfactorily. At this writing we may be permitted to claim that we have had experience, failures, and ultimate success. We are glad to say that we have so far perfected a device for burning acetylene gas that we are confident that, when it has been tested on its merit, it will meet with approval.

THE DEVELOPMENT OF HEATING BURNER.

Our first experiments were with the Buuson burner principle and construction, a flat, circular burner, with fine wire gauze, with requisite air mixer, and while with the burner thus constructed we could obtain the yellowish blue flame, the consumption of gas, as well as heat produced, was limited to a small amount. The burner became carbonized and required frequent cleaning. The slightest breath of air extinguished the flame, and the odor was disagreeable. We very early discarded this form of burner as impracticable. The burner we have produced is constructed of perforated steel, with outer and inner walls with coarser perforations on inner than on outer wall, and intended to supply the top of the burner only. At the bottom of the cylinder there is a concave surface or distributer. There is a mixing chamber, a draft stack and a feed tip, the latter so located in the draft stack as to partially mix the gas with air before reaching the burner. The secret of perfect combustion of acetylene gas consists in adding the proper proportion of air before reaching the burner.

By increasing the burner surface and supplying sufficient gas, properly mixed with air, almost any degree of heat desired may be obtained up to a certain limit. By following this rule a burner can be had that will consume all the way from 1 foot up to 10 feet per hour. Our standard size will consume about 3½ feet per hour. What is desired is the greatest amount of heat from the least amount of gas. This we believe is secured with our burner. The feed tip is so constructed that the gas enters the mixing chamber through 12 jets pointing in different directions and giving the air and gas a rotary motion, which insures a perfect admixture, that burns with a blue flame. Theoretically, the proportion of mixture is about 10 per cent. gas.

TO AVOID LIGHTING BACK.

Acetylene gas is rich in carbon, 93 per cent. carbon and 7 per cent. hydrogen. Acetylene gas contains about double the heat units contained in city gas, hence the small volume of gas per hour as compared with the city gas. The igniting point of acetylene gas is about 500 degrees C., which is a lower igniting point than any other gas. Experiments have shown that acetylene gas will ignite from a red hot wire; so, too, it will ignite in the burner if it is allowed to be heated to that point. It is therefore necessary to limit the heat produced to below that point. This is one of the causes of flashing back that has been such a troublesome feature in obtaining a practicable burner.

Our feed valve is so adjusted that the supply of gas to the burner is below this igniting point. In other words, if directions are followed there will be no flashing back with the Alpha cooker. Should this occur there is no report, no smoke or soot, no carbonizing or clogging of the burner, for the reason that the supply of gas in the draft stack is fed through a regular six-flame lighting burner, so that, in case the burner should become red hot and ignite the gas in the draft stack, it simply lights the feed tip, and it can be turned off and lighted again on top. We wish to call attention to the fact that the pressure required for our stoves is the same as for lighting, and is of sufficient range to be adapted to all generators. We build all our stoves high, for the purpose of obtaining sufficient draft; the better the draft the better the operation.

With pure acetylene gas there is practically no odor in its combustion. When certain styles of generators are adopted there will be no complaints on this score.

DEMAND.

Since placing our stove on the market we have had thousands of inquiries, and these inquiries come largely from consumers who are anxious to utilize acetylene gas for cooking, especially in summer, when the wood or coal fire is objectionable on account of the heat. The introduction of acetylene gas for cooking purposes depends largely on the generator dealer and agent. If he is prepared to give an intelligent opinion as to the merits of the stoves on the market, and advise his customers accordingly, he will find a more ready sale of generators. Perhaps few generator makers, or their agents, realize fully the advantage of being able to place a stove with a generator—very often the stove sells the generator. Not only that; but if acetylene is used for cooking a generator of double the capacity is required than for lighting alone. This means larger commissions to agents in addition to the commission on the stoves. Every generator manufacturer should have an acetylene stove in his office or factory where he can demonstrate to a customer the utility and practicability of acetylene gas for cooking purposes. The use of acetylene gas for lighting or cooking has been, is now, and will continue to be, a matter of education, and agents must be the educators.

Recently we have added a water back to our stove, which is heated by a coil placed around the perpendicular portion of the burner. This easily heats a pailful of water, while the same burner is used for cooking a meal. With our two-burner stove, fitted with coils, sufficient water can be heated for a bath as well as heating the bathroom in a short time.

The range of application of the Alpha stove is practically the same as any other gas or gasoline stove. It is adapted to all kinds of cooking and baking. At my home we have baked bread in from 35 to 40 minutes, and biscuits in 10 minutes. The baking is especially satisfactory. It is suitable for tea and coffee urns, laundry, labatory and dental work. Dentists in small towns, where other gas is not obtainable, will find the heat sufficient to melt babbitt metal, zinc and such materials as they use for molds, vulcanizing, &c. We have adopted a burner of medium capacity, but, if more heat is required, special burners can be furnished to order.

A COMMERCIAL postal card, which is being sent out by the Minnesota Stove Company of Shakopee, Minn., carries illustrations of two air tight Heaters which they are manufacturing. The first of these is known as the King Coral, which is mounted with heavy steel, has full return flue, heavy cast linings, antismoke curtain, air tight flue stop, and two griddle holes under the swing top. The Stove is referred to as a new idea in air tight construction, and as being the only base heater of its kind on the market. The second illustration is that of the Star Coral, a direct draft cast top and bottom air tight stove of attractive exterior. It is mounted with heavy sheet steel, has cast linings, antismoke curtain, screw register and one griddle hole under the swing top.

Monitor Furnaces.

A copy of the 1901 catalogue of the Keith Furnace Company of Des Moines, Iowa, devoted to the Monitor warm air furnaces, has just reached us. Following a page view of the molding room at the company's factory, the catalogue presents views of their warm air furnaces, and of parlors, sitting rooms and dining rooms in houses heated therewith. The Monitor furnace is made in a variety of styles, adapted for using hard and soft coal and wood. The soft coal furnaces are provided with a hot air blast, which can be regulated from an upper floor. The furnaces are made both with steel radiators and with all cast iron radiators, so constructed that an indirect draft is effected, with a view to utilizing the heat of the gases. The Monitor wood furnace, which is made to burn wood 3½ to 5 feet long, has a corrugated fire chamber to increase the heating surface. The products of combustion, on leaving the fire chamber proper, pass through an oval steel radiator, or find a direct outlet to the chimney, according to the manipulation of the damper. The furnaces are provided with water heaters, for use in combination heating.

The concern also make an indirect tubular hot water radiator designed for placing in the hot air chamber of the furnace to increase its heating capacity. The Monitor room heater is designed to take the cold air from the floor of a room, heating the air and discharging it through perforations at the top, so as to keep up the circulation of air in the apartment where it is used. Special cuts show the construction of the ash pit and grate and their damper attachment. The last few pages of the publication contain useful information for heating contractors and also a register price-list. The last page is devoted to a general view of the company's plant.

Kalamazoo Stove Company.

The Kalamazoo Stove Company, Kalamazoo, Mich., were incorporated June 24, with a paid capital of $65,000. The following officers were elected: Edward Woodbury, president; Wm. Thompson, vice-president and general manager; Chas. A. Dewing, treasurer, and A. H. Dane, secretary. The following Board of Directors were also elected: Edward Woodbury, Wm. S. Dewing, Chas. A. Dewing, James Dewing, Jerome M. Snook, Geo. E. Bardeen, Wm. Thompson and A. H. Dane. Wm. Thompson, the vice-president and general manager of the company, was formerly superintendent of the Buck's Stove & Range Company of St. Louis, and at present is superintendent of the Cribben-Sexton Stove Company of Chicago. He naturally is well qualified for his new connection. A. H. Dane, the secretary, is at present representing the Michigan Stove Company on the road, and is well known to the stove trade of the North and Northwest. The company will erect a modern stove plant at Kalamazoo. The main building will be 350 x 120 feet, and it is the intention of the company to put on the market a complete new line of steel ranges, cooks and special heaters. The present address of the vice-president and general manager is 633 North Boulevard, Oak Park, Ill., where all communications intended for the company should be sent.

The New Model Oak.

One of the latest additions to the extensive line of heaters which the Portsmouth Stove & Range Company of Portsmouth, Ohio, are offering the trade is the Model Oak, a handsome construction made in four sizes and with diameter of drum ranging from 12 to 18 inches. The manufacturers state that every good point or feature of construction contained in their Oak stoves has been retained, while certain new ones have been added. Special attention is drawn to the anti-buckling drum, gas burning register in the feed door, draw center grate and round air tight register, which is ground into its seat on the inside of the ash pit door and will remain at any degree of opening required to supply air for combustion.

The Model Oak has an extension cast solid on top of the fire pot extending up inside of the steel drum, but as this extension is a part of the fire pot it cannot twist and warp. A sectional ring fits over the flange turned out on bottom of the steel drum, which, in its turn, fits down on the flange of the fire pot. Then the ring and the fire pot are bolted together with the drum flange between them, the bolts being all on the outside of the stove. In the ornamentation nickel has been somewhat liberally employed, and the foot rail is sufficiently broad and depending to practically cover the fire pot section of the stove. A six-page folder which the company have issued shows a general view of the stove, as well as a sectional view, clearly indicating the essential features of construction.

THE NEGRO AS A MOLDER.

BY INSPECTOR.

About 16 years ago I had occasion to make a somewhat extended tour of the South. At that time I learned many things which were interesting, but not altogether true. Indeed, as I grow older, the fact is borne in upon me that a large part of one's life is spent in "learning things that aren't so." One of the things I learned at that time was that the negro as a molder was a discovery of inestimable value to the stove trade of the South, and in no less degree to those engaged in other branches of the foundry business. I well remember being taken through the principal foundries of Louisville, Chattanooga and other Southern cities, many of them newly established. They were full of negro molders, as happy as pigs in a puddle, dancing jigs on their molds and singing when the fancy for melody seized them. Upon inquiry I learned that the negro was a "natural born molder." One superintendent, perhaps a little more analytical than the rest, explained that molding was rather an art than a trade; that no man could attain the Empyrean hights of complete success in the casting of stove plates who was not rather an artist than a mechanic, and that the negro was gifted by nature with exactly the qualities which made him pre-eminently a success on the molding floor. He explained that the talent which enabled the negro to pick up music, and with very little trouble learn to play any instrument well, was not wholly a mental gift, but indicated a certain deftness of fingers as well. He made a better molder than the white man for the reason, among others, that in withdrawing the pattern from the sand he had a lightness and delicacy of touch peculiar to himself, and which gave his work a distinct character of its own. This was illustrated in many agreeable and instructive ways, and from what I saw in going about, I was convinced that the negro was, as my Southern friends said, a natural molder.

I remember very well that at that time the prediction was made, and believed by those who made it, that the business of stove making in the North was doomed to extinction, for the reason that, in addition to cheap iron, the South had an unlimited supply of labor in the negro, who could live for less than the white man, was content to do so, was tractable and docile, could not be organized into unions, and was, on the whole, much better than any white labor available. I was measurably credulous in those days, but I did not take this prediction quite seriously. However, it did look as if the freed man of the South had found his vocation, and that as a molder he was destined to contribute mightily to the upbuilding of the industries of the new South, and make it the natural home of the stove trade.

Well, I have just been over pretty much the same ground again within the past few weeks. I did not meet many of the same people who entertained me 16 or 17 years ago. I was sorry for this for a great many reasons, partly personal to myself and partly in the interest of an impartial reinvestigation of the subject under consideration. The vicissitudes of lean years have sent some of them out of the business. More have gone where stoves are unnecessary, a condition supposedly true of either destination in the hereafter. One cannot conceive of a climate in Heaven requiring artificial heat; still less one at the other extreme which should impose the same necessity. (I trust the reader will

pardon this digression. An old man becomes discursive when thinking of those who have preceded him across the border.) To return. My information this time was gained from a new set of foundry managers, which may account for the fact that when I asked how the negro was making out as a molder, and repeated what had been told me 16 years ago, a lambent smile overspread their faces, and what they had to tell me made me feel very much like Rip Van Winkle making inquiries about his dog Schneider. What I learned was this:

In only one stove foundry in the South, so far as is known to well informed foundry men, are negro molders employed. They are utilized for rough work of one kind or another, such as breaking pig iron, wheeling castings and the like, but not as molders. To the one foundry where they still have floors I went. It chanced to be the one whose analytical superintendent had given me the reason for the pre-eminent fitness of the negro for this work. I found about half the floors still occupied by negroes, but for quite other reasons than those which had accounted for his original employment. A free, but I think fair, paraphrase of what was told me would be about as follows:

"We employ, as you see, negroes enough to occupy about half our floors. This is not because they are good molders, for not one of them has ever attained the average standard of the white molder, or ever will. This is an open shop, and some of our people think it good policy to keep enough negroes to show that, if necessary, we could fill up with them. If a white man gets "cocky," it does him good to ask him how he would like to see a nigger get his job. If I had my way I would not have one of them around the place, but under the circumstances it may be good policy to keep a few of them simply to keep the union from attempting to get control of the shop.

"Out of the whole number of negroes we employ there are not more than six who are trustworthy men and can be relied upon. The average negro can become a good molder if he will—that is, he has the natural capacity for the business—but it is not in him. All his natural traits and instincts are against it. He takes no interest in the work, except as a means of earning wages, and rarely becomes a conscientious mechanic. He is unsteady, and if indulged in the least would invent more excuses for staying away from his work than a white man would think of. Even when he knows how to do his work properly he will not do it unless constantly watched. His percentage of defective plate is large, and he is never truthful in giving the reason for it, but will always try to throw the blame on some one else. Our white molders always have their floors put up before the blast is on the cupola, but the negroes never do. They will potter around, wasting time, and keep on molding until the bottom drops. As a consequence, much of their work is slighted. They handle the ladle very well, but it seems to be impossible to impart to them any intelligence as to the proper heat at which to pour for different kinds of work. The negro never thinks he can have his iron too hot. As a consequence he will take it as quick from the cupola to the mold as possible, and if not closely watched will pour so hot that the sand is burned to the castings.

"Another thing which it seems impossible for him to learn is the proper care of patterns, tools and other property of his employer. He is very hard on patterns and will wear them out and destroy them much faster than white men. For this reason he is not an economical workman at any price. We pay the negro on piece work very nearly as much as the white molder gets on the same class of work. The actual difference is not over 4 per cent. in favor of the white man, but in my judgment he is not worth as much as the white man by 10 or 15 per cent. He will steal anything he thinks he wants or can get money for. This is a race trait. It would not seem as if there was much about a stove foundry which would tempt to petty larceny, but our losses from stealing are considerable.

"I think it is probable that when you made your first inquiry as to the negro in stove founding, we thought better of him than we do now. Instead of improving he is deteriorating. The present generation of young negroes is not as good as that brought up under the discipline of slavery. If I owned and operated a foundry of my own, and had no one to consult as to its management, I should not have a nigger about the place at any price. This is the net result of about 19 years' experience with them.

"In some of the foundries where they do a rougher class of work than will go in a stove foundry negroes are more or less employed. I am told they do very well in certain departments of the pipe foundries, in plow works and in some other operations. I imagine, however, that even there the highest function of the negro is found in the fact that he will not join the union. For some reason he is afraid that if he did the white man would sooner or later get his job. In this he is undoubtedly right. He cannot compete on equal terms with the white molder, and if he wanted the same wages he would lose his job, sure."

I do not need to say that I came away disillusionized. The conviction so long cherished that in the foundry the negro had found his sphere of conspicuous usefulness was rudely dispelled.

The Independent Stove Pipe Radiator.

We show in the accompanying illustrations two styles of the Independent stove pipe radiator, which is being manufactured by the Independent Register Company of

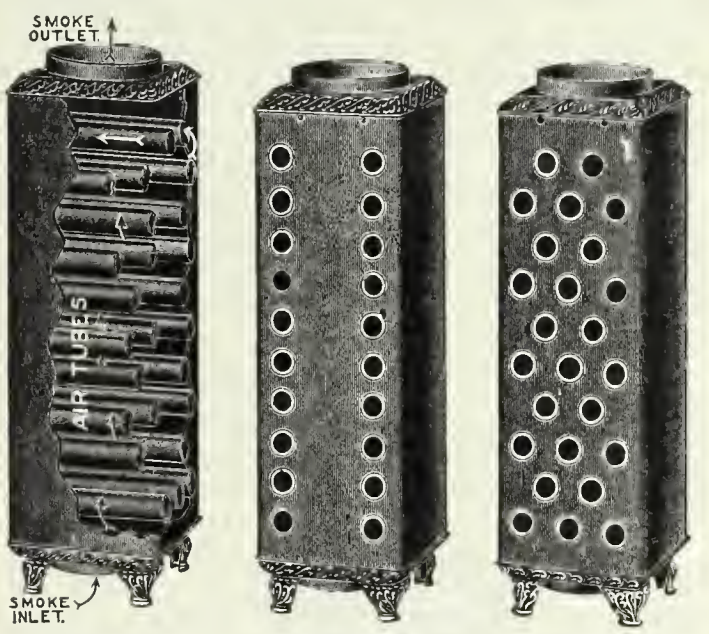

Fig. 1.—Broken View of Radiator Showing Internal Construction.

Fig. 2.—Radiator for Soft Coal.

Fig. 3.—Radiator for Any Fuel Except Soft Coal.

The Independent Stove Pipe Radiator.

Cleveland, Ohio. The radiator is made square with ornamental cast iron top and base, finished in either nickel plate or black japan, as may be desired. The outer wall or shell is made of either Russia iron or cold rolled steel, the shell being filled with steel radiating tubes which pass from the back to the front of the radiator, as indicated in Fig. 1 of the engravings, which represents a broken view of the device. By means of the arrangement employed there is a constant circulation of air through the tubes, while the products of combustion must pass over them on their way to the chimney, thus utilizing to the fullest extent the heat generated. The point is also made that a moderate circulation throughout every part of the room is created, thus producing a uniform temperature. In Fig. 2 is shown a radiator for use where soft coal or any other fuel is employed, the makers pointing out that the nature of this material is such as to require a different style of radiator from that used where hard coal, coke or wood is burned. The company state that in the construction shown they have a radiator which will not clog any more than a joint of stove pipe, while at the same time they retain the valuable radiating features of their other styles. Fig. 3 shows a radiator for use in connection with any fuel except soft coal. Here, it will be observed, the radiating tubes are "staggered" instead

of being arranged in two rows, as shown in the previous engraving. The manufacturers claim that an Independent radiator used in the same room with a stove will double its heating power, or result in an economy of fuel.

The Pioneer Stove Company.

C. S. Reynolds & Co., Columbus, Ohio, have been incorporated, with a capital stock of $100,000, uuder the style of the Pioueer Stove Company, with the following officers: George W. Lattimer, president; George B. Kauffman, vice-president; Allen W. Williams, secretary aud treasurer. The company now own all of the patterns formerly belonging to Geo. W. Gill and C. S. Reynolds & Co. Besides the present large manufacturing business, they expect to do a large jobbing business in gas stoves, oil stoves and refrigerators, and are now arrauging a large addition to their warehouses.

This business was originally established by John L. Gill in 1826, was succeeded iu 1868 by Geo. W. Gill, and in 1888 by C. S. Reynolds & Co., and was incorporated July 1, 1901, as the Pioneer Stove Company.

ODD PLATES.

W. H. Colebrook Sons & Co. of Syracuse, N. Y., have lssued a patriotic folder, prominently referring to the "Glorious Fonrth" and to tlc fact that it is the day when Americanism is the chief sentiment and one when we are proud that we are Americans. It is the day when "Old Glory" plays a conspicuous part iu the celebrations of the occasion, and the folder which the company send out is so arranged that by means of a string runuing through an eye in the card at top and bottom tlc American flag can be drawn to the top of a Liberty pole, which occupies the foreground of a picturc representing a landscape with the city in the distauce. Above the sceue is the request to "run up Old Glory at 12.01 a.m. aud don't take it down until 11.59 p.m., and make things hum all the time." Tlc front page of the folder carries tlc representation of an immense fire cracker, with a small boy about setting it off, while the fourth page is embellished with pictures of crackers and tin horns with the date July 4 in large red letters. Incidentally, the company refer to their Asbestos Furuace Cement and Stove Putty and state that Charles Smith & Co. of 122 Lake street, Chicago, Ill., are Western selling agents.

The Peerless Stove & Range Company of Columbus, Ohio, are distributing among their friends in the trade an eight-page pamphlet bouud ln paper covers of a deep red color, aud illustrating and describing the Peerless Gas Heaters. The Peerless Double Heater is of the open front style and is intended for using natural gas as a fuel. It is embellished with oxidized copper ornaments in some cases, and in others the designs include nickel plated ornaments, the bodies being of a dead black. The Peerless Queen is of the closed front style of Heater and is also intended for using natural gas as a fuel. It has Russia iron top and sides, aud the interlor construction is much the same as that employed in the Peerless open frout Heater just referred to. The statement is made that tbe No. 18 x 30 will fit into the opening of a modern wooden mantel, covering the mantel frame and making a complete fire place Heater. The sales agent for tlc Plttsburgh district is Charles A. Butler of 504-506 First avenue, Pittsburgh, whose imprint also appears upon the front cover of tlc pamphlet.

A four-page folder, just issued by tlc Buckwalter Stove Company of Royersford, Pa., illustrates and describes tlc Eclipse Junior Furnace, which is offered in five sizes and is referred to as a most efficient and practical Heater. The radiator is constructed of heavy steel plate and the joints have broad flanges packed with asbestos cement. Tlc radiating surface consists of tlc heavy fire pot with broad corrugations, conical one pieced dome, and the inner and outer surfaces of tlc radiator. A special feature of the furnace is this inner dome, which is gas and dust tight, while another feature is the triplex grate, which is the style used by the company ln all of their Ecllpse Furnaces. Illustrations are given of many of the important features of the Furnace, aud the folder as a whole is calculated to give the dealer and consumer a very good idea of the construction employed.

The Superior Mfg. Company of Allegheny, Pa., have applied for a charter. The company, who have a capital stock of $25,000, propose to go into the manufacture of Gas Logs and Asbestos and Sheet Steel Burners for the burning of gas for domestic and manufacturing purposes. Tlc concern have for some time been operating a small factory on Sherman avenue, but are now ready to move into their new quarters, a three-story factory, fronting 1600 feet on the Pennsylvania line, at the corner of Said and Magnolia streets, Allegheny. Those interested in the new concern are W. T. Bradberry, formerly of the Anschutz-Bradberry Company and later vice-president of the Pittsburgh Stove & Range Company; William H. Collingwood and Thomas M. Dudgeon, formerly with Bissell & Co., and Robert A. Bradford. The new plant will employ about 50 men.

Vulcan Club Goes to the Pan-American Exposition.

The Vulcan Club of Cleveland, Ohio, has again set the pace for organized business iuterests who may be in doubt as to the extent to which their functions may be diverted into the channels of social intercourse and recreation *en masse*. The fact that tlc furnace interests of the country at large have not been able, so far, to approach one another in the way of organization as exemplified in almost every other large industry evidently does not deter this aggressive body from going outside of its home limits—even if they are forced to convene among themselves. The time aud placc for their latest outing appear to have been well chosen—Buffalo beiug in all respects an ideal summer city, and the exposition requiring no comment, except in so far as the verdict after seeing it is that "it excels the World's Fair in many particulars, and is accessible to a larger number of people."

Fourteen of the association participated in the excursion, leaving Cleveland on the night of June 13 and arriviug at Buffalo on the moruing following. The hotel accommodations, which had been engaged in advance, left nothing to be desired. Friday and Saturday were spent within the expositiou grounds in sight seeing and on Sunday a side trip to Niagara Falls and Lewistou was undertaken. This feature of the programme was thoroughly enjoyed and it was with many regrets that the Cleveland party bid adieu to their hospitable surroundings in the Expositiou City. The Cleveland and Buffalo boat carried the party home on Sunday night, aud on 14 day books on Monday was inscribed "Best time I ever had ended this day."

The arrangements for this enjoyable affair were made and carried out by W. H. Dettlebach and Frank Potter, to whom too much credit cannot be given for its entire success. It speaks well for the strength of this organizatiou that tlc entire expense of this jaunt was defrayed by the treasurer without affecting his credit at the bank.

Percy G. James, 366 Fulton street, Jamaica, L. I., the proprietor of a very well equipped Hardware store in that town, carrying a large assortment of merchandise, has just built in the rear of his new brick storc building a two-story frame warehouse for storing such bulky goods as Lawn Mowers, Wheelbarrows, Nails, Horseshoes, Wire Cloth, &c. He has also screened the windows and doors of the entire building, front, side and rear for the protection of customers, clerks and goods from the annoyauce of flies and mosquitoes.

In the refereuce to the incorporation of the Columbiau Enamcling & Stamping .Company in our issue 22d ult. the location of the company, Terre Haute, Ind., was inadvertently omitted. It is the intention of this company to manufacture tlc lines of goods formerly made by the Bellairc Stamping Company, Harvey, Ill., whose expert labor and special talent are connected with the new concern. Tlcir new plant will be a modern one in every respect.

Arkansas Retail Hardware Dealers' Association.

The second annual meeting of the Arkansas Retail Hardware Dealers' Association was held in Hot Springs, Ark., on the 19th and 20th ult. Those present at the meeting were as follows:

E. W. Horne, Forrest City.
J. M. Pitman, Prescott.
E. E. Mitchell, Morrillton.
I. P. Rudolph, Arkadelphia.
W. M. Graham, Clarendon.
R. P. Graham, Fordyce.
H. E. Kyler, Eldorado.
W. A. Jackson, Cardanelle,
J. F. Maxey, Ozark.
J. P. Simpson, Malvern.
P. J. Tidwell, Buckner.
J. A. Plummer, Marianna.
W. L. Babcock, Hot Springs.
Frank Stearns, Hot Springs.
Mr. Whittington, Hot Springs.
Hamp Williams, Hot Springs.
T. G. Evans, Hot Springs.
Harry Vaughan, Hot Springs.
Morice Williams, Hot Springs.
John Dickerson, Hot Springs.
R. F. Roys, Russellville.
T. B. Stewart, Newport.
D. L. Graves, Arkedelphia.
K. G. McRea, Hope.
Mr. Wingfield, Hope.
Geo. R. Belding, Hot Springs.
Julian C. Brown, Hot Springs.
D. G. Fones, Little Rock.
J. Van Dokkum, Little Rock.
W. A. Cook, Little Rock.
J. H. Martin, Little Rock.
Mr. Lyons, Little Rock.
Mr. Hayes, Little Rock.
Mr. Bishop, Little Rock.
Mr. Corrington, Little Rock.
J. H. Boicourt, Little Rock.
Mr. Gladding, Memphis, Tenn.
Mr. Jackson, Indianapolis, Ind.
M. L. Corey, Argos, Ind.

Quite a number of the members were accompanied by their wives.

The meeting was called to order at 2 p.m. on the 19th.

President Horne in his annual address reviewed the steps taken to bring about the organization, and the success it was meeting, and said that much good to the members and the trade must result from it.

Secretary Plummer in his report showed the membership on June 13, 1900, was 40. He had since received applications for membership, duly indorsed, of 14 dealers, thus making the membership 54, an increase of 33 per cent. His financial report showed a total collection of $185 and disbursements of $53.75, with bills to be allowed at this meeting amounting to $70.25, leaving a balance in hand after paying expenses of $60.50.

M. L. Corey of Argos, Ind., secretary of the National Retail Hardware Dealers' Association, addressed the meeting. He outlined the work undertaken by the National Association and argued the necessity of all State associations joining it. At the close of Mr. Corey's address and after some discussion by the members, the following resolution, introduced by John M. Pitman of Prescott, was unanimously adopted:

Resolved, That the Arkansas Retail Hardware Dealers' Association become members of the National Retail Hardware Dealers' Association.

The chair appointed the following Nominating Committee: W. M. Graham, W. A. Jackson, J. P. Simpson, J. H. Boicourt, and R. F. Roys. T. G. Evans was appointed sergeant-at-arms.

At the suggestion of Mr. Corey the chair appointed a committee of two to attend to questions for the Question Box and to designate what questions should be discussed only in executive session. The chair appointed J. F. Maxey and J. P. Rudolph. On motion the association adjourned to convene Thursday, June 20, at 8.30 a.m.

Harry Vaughan of Babcock Hardware Company, Hot Springs, notified the association that the Committee of Arrangements had arranged for a hop and social at the Arlington Hotel, and extended a hearty welcome to the members and visitors.

"The Steps Necessary to Make a Success of the Hardware Business" is the title of a paper which was then read by E. E. Mitchell of Morrillton.

The following resolution was introduced and its passage recommended by the Committee on Resolutions:

"*Resolved*, That the definition of who is a retail hardware dealer, as outlined by the by-laws of the National Retail Hardware Dealers' Association, be adopted as one of our by-laws."

The association adjourned until 2 p.m.

At the afternoon session the Nominating Committee reported the following selections:

President, Jno. M. Pitman, Prescott.
First vice-president, J. F. Maxey, Ozark.
Second vice-president, T. B. Stewart, Newport.
Secretary-Treasurer, J. A. Plummer, Marianna.
Members of Executive Committee for two years:
Hamp Williams, Hot Springs.
J. H. Boicourt, Little Rock.
J. W. Lee, Fordyce.

Upon the vote being taken the above officers were unanimously elected.

On motion the Membership Committee was made to consist of five members, and its duties to assist the officers in procuring new members for the association.

The president appointed the following standing committees:

MEMBERSHIP COMMITTEE.
D. E. Watson, Hamburg. W. A. Jackson, Dardanelle.
C. T. Rosenthal, Hayesville. K. G. McRea, Hope.
D. H. Miller, Van Buren.

GRIEVANCE COMMITTEE.
J. A.Plummer, Marianna. E. W. Horne, Forrest City.
W. M. Graham, Clarendon.

COMMITTEE ON FRATERNAL RELATIONS.
I. P. Rudolph, Arkadelphia. W. B. Pillow, Helena.
F. L. Curfman, De Queen.

COMMITTEE ON TRANSPORTATION.
F. C. Stearns, Hot Springs. J. H. Boicourt, Little Rock.
F. B. Gregg, Little Rock.

PROGRAMME COMMITTEE.
E. E.Mitchell, Morrillton. W. L. Babcock, Hot Springs.
R. P. Graham, Fordyce.

On motion the president was appointed a delegate to the National Association.

Some of the questions from the question box were read, and the discussions participated in by quite a large percentage of the members. Among the questions were the following:

"What do you think of the new law against range, vehicle and other peddlers?"

"What is the best plan to be sure that a salesman puts all the cash he receives in the till?"

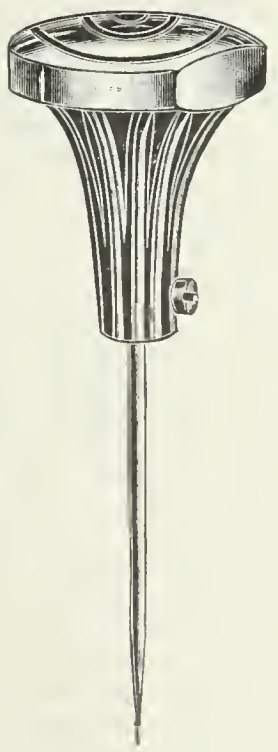
"Is the giving of premiums for purchases advisable, and if so, what is the best method?"

"Is the distribution of calendars and souvenirs a judicious system of advertising? if so, what is the best method of distribution?"

The next meeting will be held at Little Rock, Ark., on the third Wednesday in June, 1902.

The Modern Ice Pick.

Gilchrist & Means, 43 South Canal street, Chicago, Ill., have just placed on the market the ice pick herewith shown. The handle is of solid metal, making it quite

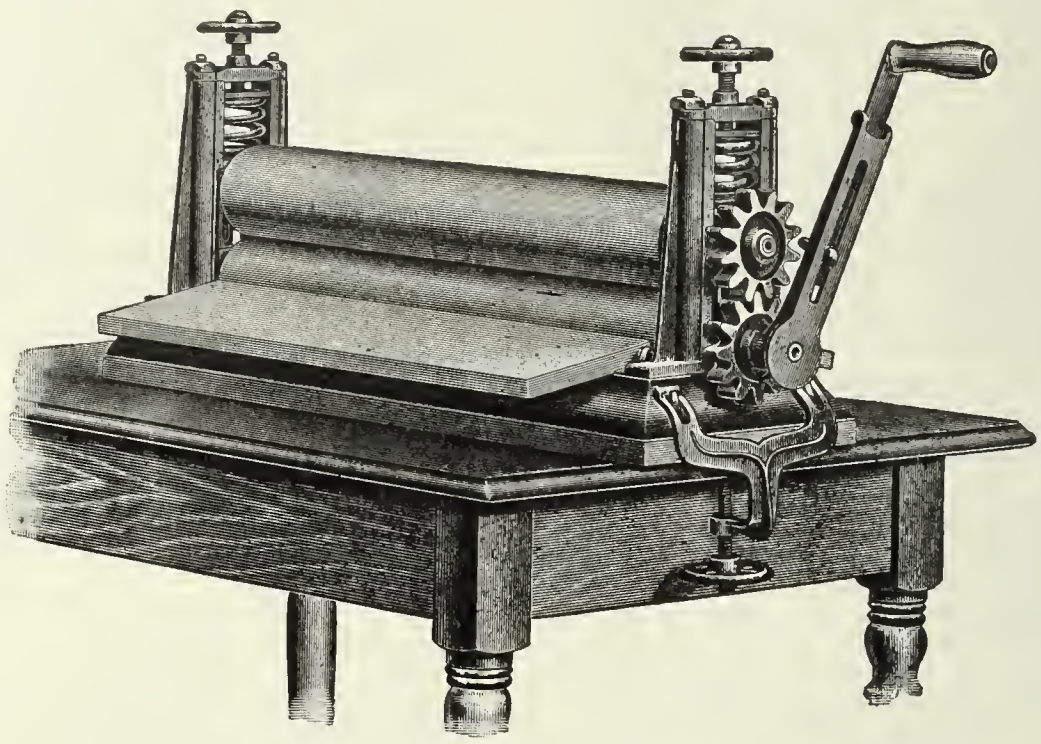


The Modern Ice Pick.

heavy. The pick is nickel plated, and one style is made with the head of the set screw countersunk, so that it does not project beyond the surface. No hammer or mallet is required in using the pick, a succession of smart strokes cracking the ice as desired.

The Household Mangle No. 21.

Herewith illustrated is a household cold mangle, manufactured by the Lawson Novelty Company, 115 Lake street, Chicago, Ill. The mangle is designed for domestic use. The machine is constructed with a strong coil spring at the end of the rolls. The shaft of the upper roll revolves on sliding journals so that the rolls may adjust themselves to the varying thickness of the goods.



The Household Mangle No. 21.

The mangle is geared to run smoothly and easily, and is supplied with an adjustable crank which can be made longer or shorter. The pressure between the rollers can be adjusted, it is explained, up to 700 pounds by the aid of the hand wheels above the coil springs. The mangle is so made that it can be readily attached to a table or shelf, and is made reversible so that it can be operated by either the right or left hand. The rollers are 4 inches in diameter, 24 inches long, and the machine occupies a floor space 15 x 30 inches.

A New Locomotive.

A locomotive of new and unique design was recently constructed by Walter E. Williams, San Diego, Cal., for his show window. It proved a strong drawing card, and was the recipient of much attention, being finally bought by an admirer, who took it into Mexico and Central America to show the "greasers" a "Yankee trick."

The locomotive was built up on a bed plate made of 1-inch board, 9 inches wide and 30 inches long, painted black. On this was placed the boiler, consisting of a joint of 7-inch stove pipe 24 inches long. The smoke stack consisted of a 1-Quart Tin Fruit Can, capped with a Nickel Cuspidor. A small Tin Pan served as the headlight. The bell was an Agate Funnel held in place by a frame made of Sheet Iron Strips. A small Stove Knob represented the clapper. The steam dome was made of a large Tea Canister, surmounted with a large Nickel Stove Knob, serving as the whistle. Two Drip Pans, fastened top to top with strips of Sheet Iron around Wire at corners of Pans, and standing on end, the bottoms facing front and back, formed the cab of the locomotive. The bell cord was made of a small Dog Chain. The cylinders consisted of Japanned Flour Dredge Boxes. Tin Pans served as wheels, a larger size being used for the driving wheels than for the pilot truck. These wheels were fastened to the wooden bed piece. The driving and connecting rods were made of strips of Tin. A Dust Pan served as the cowcatcher.

The tender was constructed with a bed piece of 1-inch board, 9 inches wide and 12 inches long, also painted black. To this two wheels were fastened on each side, the wheels being made of small Tin Pans, like those on the forward truck of the engine. Two Roasting Pans were fastened together, top to top. The bottom of one was laid on the bed board. This completed the tender. The wording used on the tender just described was: "San Diego & Salt Lake Railroad. No. 1."

Original Measuring Spoons.

Enterprise Mfg. Company, Everett, Mass., are the makers of the Original measuring spoons here illustrated. The three sizes eyeleted together, as shown in Fig. 1, can be used as seen in Fig 2 to accurately measure liquids named in cooking receipts, the three spoons

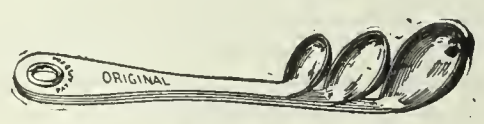


Fig. 1.—Original Measuring Spoon.

having a capacity of one-quarter, one-half and three-quarter teaspoonful, by the use of which units any desired proportion can be quickly and correctly obtained.

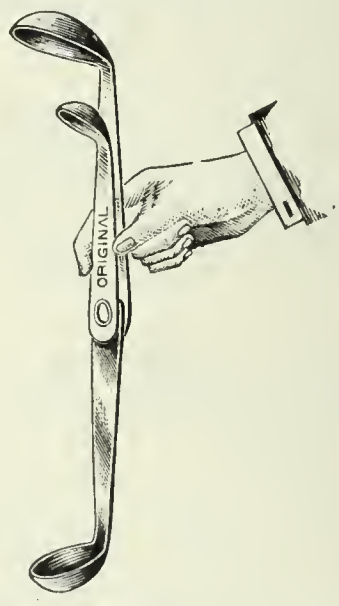

Fig. 2.—Method of Using Spoon.

These spoons are graduated to 15, 30 and 60 drops, respectively, these quantities being equivalent to ¼, ½ and 1 teaspoonful.

THE DUBUQUE ENAMELING WORKS, Dubuque, Iowa, have been reorganized and incorporated under the name of the Western Enameling Works, with a capital of $100,000. They will manufacture all kinds of Enameled Ware.

PAPERS FOR ENGINEERS' MEETING.

The preparations for the summer meeting of the American Society of Heating and Ventilating Engineers, to be held in Chicago, July 12 and 13, are progressing satisfactorily. We are informed by the secretary that the following papers will be read and discussed:

"Test of Radiators with Superheated Steam," by R. C. Carpenter.

"Heating with Hot Air Furnaces," by C. G. Folsom.

"Heating Systems in St. Louis Schools," by Alvin D. Reed.

"Quantity of Water in Hot Water Heating Systems," by W. M. Mackay.

"Efficiency of Different Parts of Boiler Fire Boxes," by R. C. Carpenter.

GOOD FITTINGS WANTED IN INDIA.

Water in India is dear, writes an English correspondent of *The Metal Worker*, and it is therefore very important that makers of plumbing goods who supply this market should see to the quality. It is computed by the water works engineer of Wolverhampton that the following descriptions of fittings are liable to give the following leakage (pressure not stated):

Waste by Leakage in 24 Hours.

Description of fitting.	Gallons.
½-inch tap, with bad washer	700
⅝-inch tap, with bad washer	920
¾-inch screw stripped washer	12,720
⅝-inch ball tap, washer bad	900
⅝-inch ball, lever strained	200
⅜-inch pipe burst	11,280
½-inch pipe burst	17,280
¾-inch tap, left open	23,520
½-inch tap, left open	12,000
⅝-inch tap, left open	9,600

This may not appear to be a serious business so far as America or England is concerned, although it is bad enough, but in India, if a 3-inch tap is left flowing day and night, it means a bill of Rs. 7-3-0, or Rs. 215-10-0 ($75) per month. It would seem, therefore, a good thing if some tap manufacturer could persuade Indian municipalities as to the special advantages of his make. If he succeeded, there is no reason why he should not drive a big trade in plumbers' goods with Bombay, Bengal, Calcutta, Madras, Delhi, Simla, Quetta, Agra and other places. The whole question of the water supply in Indian towns is a very important one, and any schemes that make for economy will be heartily welcomed by Indian municipal administrators.

CANADIAN MASTER PLUMBERS.

The annual convention of the National Association of Master Plumbers and Steam Fitters of Canada was held in Toronto last week. The early sessions were occupied with discussions of the proposed provincial associations to be composed of representatives of local associations, and to have representation in the National Association. The afternoon was occupied by a drive to points of interest in the city, and in the evening the delegates were dined. Among the speakers was Edward Gurney of the Gurney Heater Mfg. Company, who complimented the association on the prosperity it displayed.

On the last day of the convention, after inspection of the reports of the committees and the disposal of ordinary routine business, the following officers were elected:

President, John McKinley, Ottawa.

Vice-President, Frank Powers, Nova Scotia.

Secretary, H. A. Knox, Ottawa.

Treasurer, Joseph La Marche, Montreal.

Provincial Vice-Presidents, Nova Scotia, Cape Breton and Prince Edward Island, G. H. Perrier, Halifax; New Brunswick, James Walker, St. John; Quebec, John Wilson, Montreal; Ontario, W. Mansell, Toronto; Manitoba, Capt. Joseph Giroux, Montreal; British Columbia, James H. Wilson, Toronto.

The following chairmen of standing committees were appointed: Sanitary, J. W. Hughes, Montreal; Apprentices, Robert Ross, Toronto; Legislative, E. B. Butterworth, Ottawa; Essay, George Martin, Yarmouth, N. S.

The next convention will be held at Halifax.

Glauber Brass Goods.

A 140-page publication known as Catalogue D, 1901, recently has been issued by the Glauber Brass Mfg. Company of Cleveland, Ohio. The first page shows a picture of their offices and works, which during the past year have been increased by a new addition giving nearly three times the floor space heretofore available. A well arranged index and telegraphic code occupy several pages. The following 14 pages are devoted to Glauber's stop and waste cocks for iron and lead pipe with tee and lever handles, either separate or attached. The next few pages are devoted to hydrant cocks of various styles, followed by finished stop and waste cocks for making the various combinations of iron and lead pipe, some with coupling. Corporation cocks and curb cocks in a variety of styles occupy another section of the catalogue. Finished compression bibs, plain and hose bibs of different patterns adapted for lead and iron pipe for sinks and laundry trays, stop cocks, angle cocks and sill cocks are also shown in variety. Another section of the catalogue is devoted to Fuller work in plain and hose bibs for lead and iron pipe with flanges and thimbles, and in many special forms adapted to all kinds of special work.

These are followed by a variety of bath, basin and pantry cocks, all of the Fuller pattern. Compression basin cocks and compression double bath cocks with and without jewel and soap cups are also shown in great variety. Another section of the catalogue is occupied by a line of special fittings, such as basin cock supply pipes, couplings, slip joints, bath cock couplings, boiler couplings, trap screws, plain ferrules, basin clamps, basin cock fasteners, closet repairers, chain stays, plugs, Fuller balls, bib washers, floor gaskets for closets, hose couplings and band piyers. Another section is devoted to globe valves, check valves, service and steam cocks, air cocks, safety valves, oil cups and gauge cocks. The company claim that for quality of workmanship and excellence of design, finish and material their productions are entitled to consideration by all who cater to first-class work, and they invite a careful trial of their many specialties, feeling sure that the result will be to increase their trade.

The Henderson-Thermo Boilers.

A convenient addition to trade literature, particularly useful to those who sell and install the Henderson-Thermo steam and hot water heaters, has recently been issued by the Prizer-Painter Stove & Heater Company of Reading, Pa. The catalogue consists of 54 pages bound in a red cover on which there is an embossed design bearing the address of the house and showing their trade-mark and monogram. The first page is occupied by a picture of their manufacturing plant, and another page bears the statement, "We sell only to heating contractors." The next 20 pages are devoted to the company's heater for hot water systems, with views showing the completed heater and the heater partially erected, indicating both the fire and water travel and the detail of its construction, together with the company's special hot blast for promoting combustion, so that the merits of the heater may be readily understood. In connection with the very comprehensive explanation given in the text the advantages of the twin sections are presented, particularly when heaters of large size are to be installed. In the construction of the heater the parts to be handled by steam fitters are small and light and are readily carried in through the doors of buildings of any character.

The connections are made by means of slip nipples. The arrangement of the surface and the waterways is such as to promote combustion, facilitate circulation and secure the greatest efficiency from the fuel consumed. By the use of an upper crown sheet a very large fire surface is presented, a good portion of which is of a vertical character. Another feature of the heater is the construction of the base, which forms a continuous waterway on three sides into which the return pipes are connected, and the lower ends of the vertical sections which form the heater. This base is also used to sup-

port a rocking and dumping grate, designed not only to quickly clean the fire, but also to admit ample air supply to support combustion and to be capable of long service.

An interesting portion of the text is the information regarding the capacity of the heaters, the burning of the gases and the material of which the heaters are constructed. The various parts are made interchangeable, and ample facilities are provided for cleaning and draining the heaters. It is pointed out that, owing to the construction of the hot air blast running the full length of the fire chamber on each side at the surface of the fire no difficulty is experienced in operating these heaters with soft coal of fair quality. Their special adaptability for the requirements of the greenhouse heating trade is also explained. The heaters are made with grates 19, 28 and 41 inches wide, in 12 different sizes rated to carry from 625 to 5300 feet of radiation. Plates are presented showing elevation of the heaters with letters referring to a table which gives the complete dimensions.

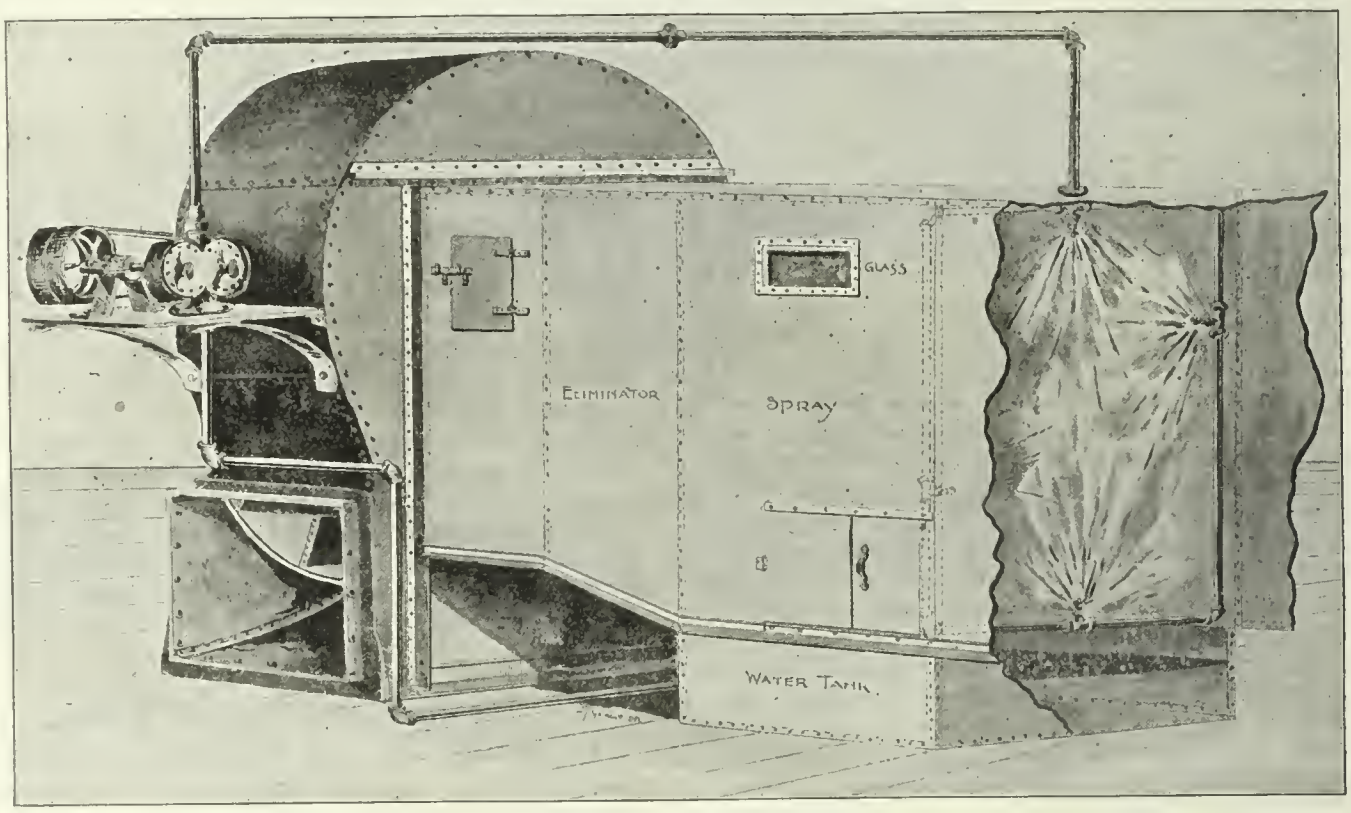

Fig. 1.—The Thomas Acme Air Washer and Purifier.

The latter portion of the catalogue is devoted to the company's steam heaters, patterns for which have recently been completed. These heaters are essentially the same in construction as the water heater, with the addition of a large steam chamber at the top. They are made in the same variety of sizes and are rated to carry from 375 to 3200 square feet of direct steam radiation. In connection with tables giving the dimensions, capacity and ratings of the heaters, there is a page explaining the method of rating the heaters and the allowances that must be made for the piping to the radiators. A well arranged telegraphic code is provided.

The Thomas Acme Air Washer and Purifier.

We herewith illustrate a new device manufactured by Thomas & Smith of 16 North Canal street, Chicago, and called Thomas' Acme air washer and purifier. The primary object sought by the inventor was the removal of dirt or other offensive and injurious matter from the air introduced into buildings by blowers or fans used for either heating or ventilating. The air after passing through the apparatus is not only clean and dry, but the impurities are eliminated, and a healthy degree of humidity is maintained irrespective of any outside hygrometric changes. The system has also simplified the question of cooling air in summer, as with a reasonable quantity of ice in the water tank the temperature of the passing air can be reduced many degrees. The apparatus consists essentially of a spray chamber and an eliminator. The spray pipe contains a number of nozzles set at regular distances. Between the two walls of the spray chamber is a suspended partition which causes the air to go under it, thus passing through the water from the nozzles, which are placed on one of the chamber walls at a level with the bottom of the partition. The air, thus passing through the water, is freed from some of the dirt or impurities, and then passes upward to the eliminator. This consists of a series of steel baffle plates, placed in alternating rows. When the air strikes the first row of plates it rebounds to the second, then to the third, &c., taking a circular motion, which retards the solid impurities left in it and deposits them on the baffles, sifting and drying the air. From the eliminator the air passes to the inlet of a fan. In winter tempering coils are used to keep the water from freezing. The fan then forces the purified air through the usual heating coils. All heavy particles, such as soot, dust, &c., are deposited at the bottom of the tank. The apparatus is stated to be very economical in the consumption of water, always ready to do its work and not liable to easily get out of order.

It has been installed in a number of important buildings in Chicago with gratifying results. A notable instance is the installation in the Chicago Public Library, which is located in a district surrounded by smoky chimneys, spice mills, coffee roasting establishments, &c. No odors are now observed in the building, and the books and papers are free from former accumulations of dust and soot.

THE AMERICAN RADIATOR COMPANY have recently improved the appearance of their new showroom at 40 and 42 East Twentieth street, New York, by tinting the walls a very pretty green and freshening up their samples of Steam and Hot Water Boilers and Radiators. Suggestions for the decoration of Radiators can readily be secured by looking over the samples displayed in the company's showrooms. Another attractive feature consists of large sized pictures of the manufacturing plants of the company, including the Standard, Detroit, Michigan, St. Louis, Steel, Pierce and Titusville plants. These views give a very comprehensive idea of the enormous capacity possessed by the company for producing Radiators.

THE BARNES MFG. COMPANY, Mansfield, Ohio, manufacturers of Single and Double Acting Iron Hand and Power Pumps and Cast Iron Sinks, are erecting an addition to their plant. The structure will be of brick and

stone, 30 x 60 feet, two stories, and will be used solely for office purposes. The company report an increasing demand for their goods, and they are now shipping their product to all parts of the globe. They have also largely increased their capacity by the addition of new machinery and have prepared a handsome new catalogue which is ready for distribution.

New York City Notes.

Business has been quiet for the past week, owing to the intense heat and the intervening holiday. Many of the trade took a run to the country and seashore to escape the heat, and none were over anxious in looking for new business.

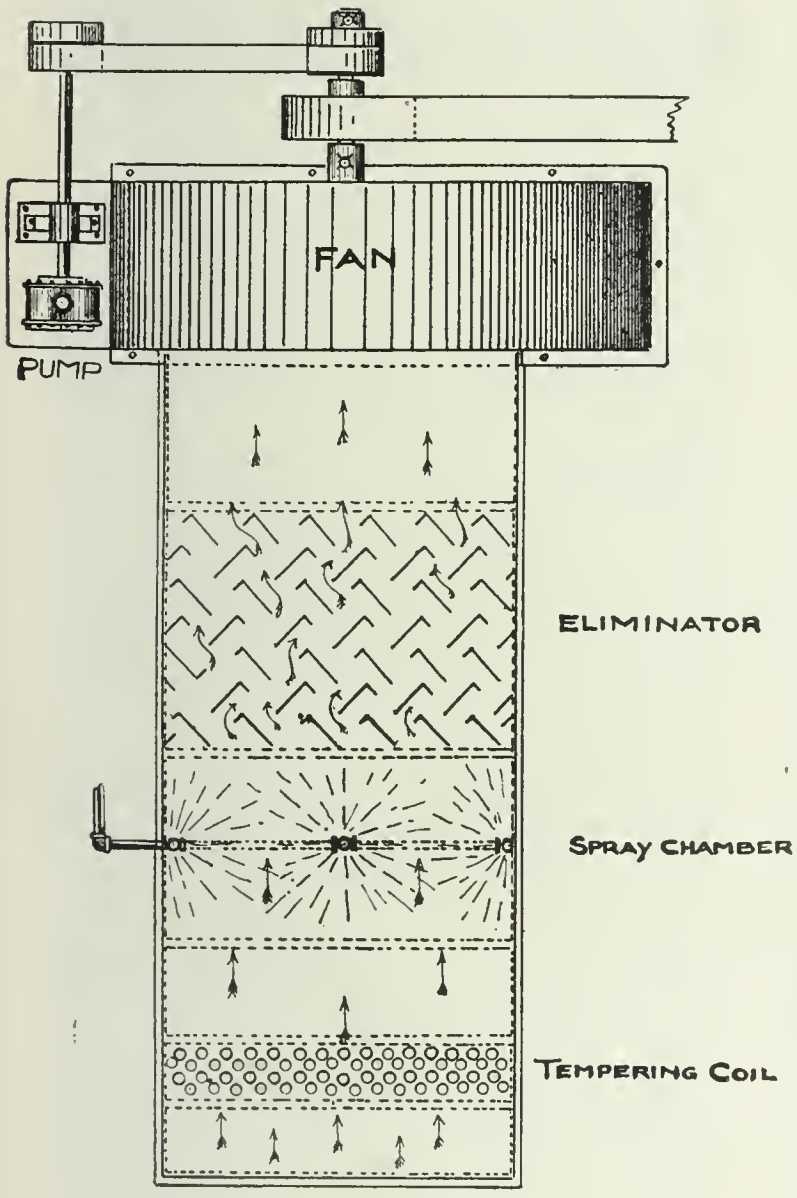

Fig. 2.—Plan.

* * *

Lyman & Costello are plumbing an apartment hotel that is being erected on Fifty-ninth street, running with an L to Park avenue, around the Board of Education Building.

* * *

Mr. and Mrs. I. J. Brown have just returned from an extended trip, which they took after the Kansas City convention, going all through Nebraska and as far as Denver.

* * *

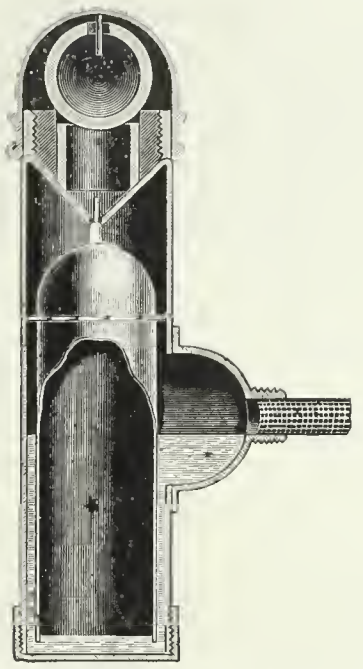
The heat has not deterred applicants for a certificate of competency from the Examining Board of Plumbers. The number of applicants each month keeps up the average, although many do not pass the examination who apply.

* * *

Selling material to finish stuck jobs is going on at times, but the lines are being drawn so close that all sorts of subterfuges have to be used to obtain the same, even so far as delivering the material at one place and then carting it away to where it is to be put in.

Air Valve for Vacuum Heating Systems.

In the accompanying illustrations we show some new air valves manufactured by Morgan & Co., 40 Dearborn street, Chicago, Ill., and designed for use in connection with low pressure and vacuum heating systems. It is pointed out that in this device the company have been enabled by the use of rubber to produce a



Air Valve For Vacuum Heating Systems.—Fig. 1.—Valve Closed.

valve which fits closely enough to establish and maintain a vacuum. The objection to the use of rubber in the construction of air valves is met by the fact that it is cheap and can be easily replaced. The construction provides a vulcanite cylinder, which has a sharp edge, against which a hollow rubber ball makes a seat. The vulcanite, softening somewhat under heat, obviates the sharp edge cutting the ball, while aiding in maintaining a perfectly air tight seat. In operation, the lower end of the float being in the well formed by the portion of the valve below the nipple connection, is sealed by the

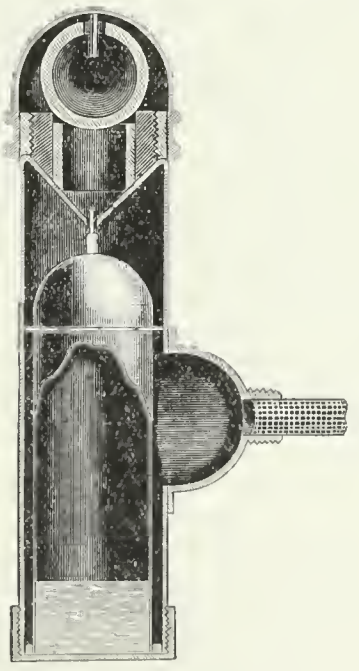


Fig. 2.—Valve Open.

water of condensation. The heat expands the air thus sealed in the float and raises the float to its seat, as shown by the sectional illustration given in Fig. 1. Should the pressure increase to the point of compressing the expanded air in the float, the water is forced into the float, keeping it pressed against the seat and the valve closed. As the pressure subsides the air that was compressed expands, forcing the water from the float into the well, and the float remains in the seat through flotation.

In absence of heat, the water in the well is drawn into the float, as shown in Fig 2, by the contraction of

the air in the float, and this water, adding its weight to the float, causes it to drop and leave the valve open. Any air that has been displaced from the float during the operation is replaeed by gravity as soon as the water in the well entering the float reaches the level of the bottom of the float. This is the action or principle whieh is depended upon to maintain an equilibrium. The expansion of air by heat is relied upon to make the operation of the valve in the highest degree sensitive. The swell between the nipple conneetion and the body of the valve prevents capilliary attraction, rendering unnecessary the use of a siphon or double passage through the nipple. The screen at the end of the nipple is of brass gauze, and is designed for the purpose of maintaining a steady water line in the valves, irrespective of an irregular water line in the radiator, due to carelessness in the manipulation of the radiator valves. The flange on the float above the inlet of the valve serves to raise the float quickly to its seat and close the valve in case of a rapid inflow of water from the radiator. The pin at the top of the float is made of German silver, and so constructed as to prevent the pin from becoming stuck in the seat and keeping the valve closed when it should be open. Morgan & Co. issue an attractive catalogue, giving illustrations and full description of the constructiou and operation of the valve. This publication can be secured on application.

Heating and Plumbing Notes.

A. H. Warner and C. C. Spellman, assignees of the E. Stebbins Mfg. Company, Springfield, Mass., advise us that the information given in an item published in these columns on June 22 in regard to the indefinite closing down of the company's plant at Brightwood, Mass., was incorrect. The works were only closed for two days in order to make the necessary inventory. The company's plant is now rnnning with full force and with no prospect of a suspension of operations.

Two interesting little pamphlets are issued by the F. W. Foster Mfg. Company of 6 Portland street, Boston, Mass., one of which is devoted to the Foster Shaking Grates for steam power boilers, adapted to square and round fire chambers and to all sizes and kinds of fuel. The different styles of Grate and the method of applying them are shown by means of the illustrations. The pamphlet also gives a list of large steam power plants and public buildings in which these Grates are giving satisfactory service. The other pamphlet, entitled " The Kind That Never Leak," is devoted to the Foster Ball Cock, which is adapted for water closet flush tanks as a float valve for working under either high or low pressure. It is also used in conneetion with a boiler feeder to keep the water line in the boiler always at the same hight. The device is further shown in connection with a water gauge box, so that the gauge glass will always show the water liue maintained by the boiler feeder. This catalogue should be of interest to both plumbers and heating contractors.

Swing & Bateman, Philadelphia, have a $4000 contract for installing a steam heating plant at 1207 Walnut street, for the Central Realty Company.

The Allegheny Heating Company of Pittsburgh, Pa., have declared the regular qnarterly dividend of 3 per cent. and an extra dividend of 5 per cent., payable July 25.

The Reineke-Wilson Company, Pittsburgh, Pa., are sending to the trade a 12-page folder relating to the various kinds of goods which they manufacture. One page is devoted to their special catalogues. Catalogue 27 is occupied by a complete line of Pumps and Pump Appurtenances. Catalogue 16 is for Hose and Hose Reels and Brass Goods. Catalogue 20 shows Gas and Electric Lighting Fixtures. Catalogue 24 is devoted to Gas Stoves, Gas Burners, Fittings and Supplies. Catalogue 25 shows Gas Lamps, Acetylene Lamps and Glassware for incandescent and acetylene lighting. Catalogue 26 contains Gas Ranges, Hot Blast Water Heaters and Gas Cooking Appliances. Catalogue 23 is devoted to Gas Heating Stoves, Radiators, Fire Place and General Gas Heating Appliances. Catalogue 28, which is in eourse of completion and will be issued about August 1, will show a new line of Gas Chandeliers and Lighting Goods.

Gunster & Forsyth, Scranton, Pa., have recently contracted to do the plumbing, gas fitting, steam heating, copper cornice and dome, and skylight work in the new Merehants' and Meehanics' Building, Scranton. The firm have at present work engaged that will employ them for the balance of this year.

George A. Cranford & Co. will occupy one of the stores in the new three-story brick building on Main street, Mount Desert, Maine, with their plumbing shop and showroom.

Allen H. Tyler, 244 Putnam street, Collinwood, Ohio, clerk of the Board of Education, will receive bids until July 24 for heating and ventilating a four-room school building.

Runyon & Ogden, Binghamton, N. Y., were the lowest bidders, at $13,917, for heating and ventilating the new Fredonia Normal School.

At the meeting of the Association of Manufacturers and Jobbers in Plumbing Supplies held recently in Detroit, a resolution was adopted to the effect that on and after July 1, 1901, all members of the association would charge for boxing and packages. Copies of this resolution have been sent out by Secretary C. W. Woodward to the plumbing trade at large.

C. A. Ludden of Chicopee, Mass., has the contract for a heating plant in the addition to the Town Hall at Springfield, Mass.

C. K. Fankhauser has been elected president of the National Steam Economizer Company, Springfield, Mass., to sueeeed R. H. Smith, who resigned the position. The company make a specialty of the Keller apparatns for utilizing exhaust steam and their apparatus is in use in some of the largest steam plants in the country.

The Master Plumbers' Association of Syracuse, N. Y., have locked out about 200 journeyman plumbers, members of the local union, because of their alleged inconsistent demands. The rules of the union restrict members from riding a bicycle to and from work, between the hours of 8 o'elock to noon, and from 1 o'clock to 5 p.m., also from working more than seven hours on Saturday. The journeymen assert that they are willing to use any kind of vehicle other than a bicycle in going to and from work, saying that they cannot afford to buy bicycles and keep them in repair.

The plumbers of Spokane, Wash., have demanded the resignation of some of the men appointed to act on the City Examining Board of Plumbers, and have recommended other men for appointment in their places.

The Atlanta Steam Company of Atlanta, Ga., have a contract for removing the old heating system from the Custom House in that city, and substituting a new low pressure steam apparatus.

James T. Murray, Hartford, Conn., is installing two boilers and overhauling the heating system in the Ætna Life Insurance Building in that city. He also has a contract to place two large tubular boilers in the Hartford Hospital.

Libby & Blinn, Hartford, Conn., have a contract for removing the old and putting in new steam heating apparatus in the new City Hotel, and are installing a ten-section Mercer hot water boiler in the six-tenement block of W. W. Evans, in that city. They have just completed alterations of the entire heating apparatus in the Bliss Block, and are rearranging the hot water system in the residence of Caroline E. Day, using two Cottage boilers. The firm also have been awarded the eontract for heating the four-story warehouse and three sweat room erected by Sutter Brothers, using a 13-section No. 3 Mercer steam boiler.

The strike of the plumbers at Grand Rapids, Mieh., has been called off by Vice-President Saeger of the International Union. The master plumbers have agreed to pay $3 a day of nine hours, with the privilege of hirlng either union or nonunion men, as they might prefer. The

chief point of the strike was for the recognition of the union.

FRANK J. PAGE, who is well known to the heating trade, is now visiting the steam and hot water fitters in the interest of the Richmond Stove Company of Norwich, Conn.

THE GURNEY HEATER MFG. COMPANY of Boston have engaged J. S. Matson to look after the interests of the Gurney Steam and Hot Water Boilers and Radiators in Eastern Pennsylvania and Philadelphia.

EDWIN CONNELL, 113 Pearl street, Somerville, Mass., has recently enlarged his plumbing establishment to meet the demands of his rapidly increasing business.

DANIEL FARREL of Anniston, Ala., bid $7445 and was the lowest bidder for heating the City Hall at Birmingham. The Peck-Hammond Company of Cincinnati bid $5040 and were the lowest bidders for the plumbing work.

JAMES B. CLOW & SONS, Chicago, Ill., have purchased the entire plant, including machinery and stock, of the Cuyhoga Marble & Stone Company, Cleveland, Ohio. The whole outfit will be moved to Chicago for the enlargement of their marble mill there.

THE DEMPSTER MILL MFG. COMPANY, Beatrice, Neb., manufacturers of Wind Mills, Pumps, Tanks, &c., are enlarging their plant by building additions to the machine shop and foundry, and by the erection of a new complete galvanizing plant for galvanizing Wind Mills and Wind Mill material. The cost of the additions, with the new machinery which will be installed, will be about $20,000, and the capacity of the machine shop and foundry will be increased about one-third.

G. B. GAYLORD, manager of the American Supply Company, of Springfield, Mass., has received official notice from Washington that his application for letters patent on Float Actuated Valves has been allowed. Mr. Gaylord intends to have his company incorporated and with increased capital add to the present business of dealing in Plumbers' and Tinners' Supplies that of manufacturing and handling the new Valve.

MICHAEL HEERY of Topeka, Kan., has secured a $10,524 contract to heat the State House in that city.

THE long drawn out strike of the Detroit plumbers is ended. The men went out two months ago upon the refusal of the employers to recognize the union scale and union hours, and the fight has been a bitter one. The employers imported a few men, but as a rule were compelled to don overalls themselves and get down to hard work to take care of their orders. They held out the longest and on June 27 the strikers held a meeting and accepted the terms of the employers, so that all returned to work at the old wages.

THE ENGINEERING & STEAM SUPPLIES COMPANY have filed articles of incorporation at Minneapolis, Minn., The incorporators are Hubert Kelly, E. G. Walton, John N. Smith, B. M. Kelly, M. F. Byrnes, all of Minneapolis. The capital stock is $25,000.

THE LOCKE & SMITH COMPANY of New York City have been incorporated, with a capital of $60,000, to manufacture Plumbers' Supplies. The directors are H. M. Smith, William E. Lawton and A. J. Davidson of New York City.

IN the report of the annual meeting of the International Acetylene Association, held in Buffalo, in *The Metal Worker*, June 22, the name of the Abner Acetylene Gas Company of Chicago was omitted from the list of those present. It might have been thought that the omission was purposely made to render their name more conspicuous by absence, but, as a matter of fact, it was omitted by pure and unintentional accident.

New Firms and Changes.

A CHARTER has been granted to the Davidson Heating & Construction Company of Hanover, Pa. The directors are McC. Davidson, D. D. Ehrhart and C. E. Ehrnart and the capital stock is $15,000. P. M. Weist is treasurer of the concern.

THE CENTRAL SUPPLY COMPANY have been incoporated, at Worcester, Mass., with I. P. Smith as president and J. P. Ashey as treasurer, to deal in Steam Fitters' Supplies and Plumbing Goods.

THE NATIONAL PLUMBING & HEATING COMPANY have been incorporated, at Milwaukee, Wis., by G. C. English, G. Boemer and John H. Boemer, with a capital stock of $2000, to do a general plumbing, gas fitting and steam heating business.

BATEMAN & O'BRINE are a new firm in the plumbing business at Concord, N. H.

THE SELLNER GAS & ELECTRIC FIXTURE MFG. COMPANY of St. Louis, Mo., with a capital stock of $25,000, have been incorporated by Albert C. Sellner, William A. Gardner, Herman Goodman and others.

THE NEW JERSEY SANITATION COMPANY, 15 Exchange place, Jersey City, have been incorporated, with a capital of $125,000, to deal in Sanitary Supplies. Patrick H. Connolly, Wm. J. Davis and John F. Reilly are the incorporators.

MILLINGTON & MILLER, 113 Kossuth street, Bridgeport, Conn., have succeeded to the heating contracting branch of the business of the Bridgeport Steam Heating Company. The old company will confine their business to the jobbing of supplies and to high pressure installations.

International Exhibition of Modern Art Products.

We have received from General L. P. di Cesnola, director of the Metropolitan Museum of Art of New York city, a copy of the programme for the first International Exhibition of Modern Decorative Art, which is to be held in the City of Turin, Italy, in the year 1902. General di Cesnola, who is Commissioner-General of the exhibition for the United States, is anxious that American manufacturers engaged in the lines which will be represented should be made aware of the favorable opportunities offered in connection with this enterprise for the exhibition and introduction of their goods into foreign countries. The undertaking is under the patronage of the King of Italy, and his cousin, the Duke d'Aosta, is president of the same. In connection with the programme, the statement is made that the exhibition is not to be merely a reflection of other industrial exhibitions so often repeated, neither is it intended to show reproductions of styles already known, nor simply industrial productions that are wanting in artistic merit, but it is opened solely to original productions tending to the improvement of the artistic form in modern decorative art. The departments which will be of more especial interest to our readers are those of warming apparatus and accessories, such as stoves, registers, fire dogs, fire guards, &c., lighting apparatus of all kinds, and metal work, engraved, embossed, beaten or cast. These are included in the first class of exhibits under the general heading of "The Modern House and Its Decorative Elements." Information regarding the proposed exhibition can be obtained either from General di Cesnola, Metropolitan Museum of Art, Central Park, New York city, or from the Exhibition Committee, 28 Via Ospedale, Turin, Italy.

The *Journal* of Kennebec, Maine, says that the carpenters of that region 100 years ago and more were in the habit of using birch bark in place of sheathing paper in the erection of the better class of dwelling houses. While overhauling some houses in Saco recently it was found desirable to pull off some of the clapboards, underneath which were found what appeared to be loose pieces of birch bark. On further investigation the carpenters found that when the house was built, in 1782, sheets of birch bark were laid on the sheathing to close over the cracks. These sheets were held by small hand made nails of wrought iron, over which were laid clapboards of pumpkin pine. This sheathing material was found to be in an excellent state of preservation.

According to the figures of the Department of Buildings of New York City, there are 60,502 street lights maintained in the city, including 40,628 gas lamps and 15,682 electric lights.

The Tin Plate Scale.

At a meeting of the tin plate wage committee of the Amalgamated Association, and J. Warner Arms, representative of the American Tin Plate Company, held in Cleveland last week, the scale fixing wages for tin plate mills for the year beginning July 1 was arranged. The men received a slight advance on gauges 21 to 28 inclusive, while the catchers also got an advance of about 10 per cent. Some concessions were also made in the footnotes and material changes in clause No. 6 in the old scale, but from No. 5 in the new scale, were made. The new scale in full is as follows:

The Tin Plate Scale.

Gauges.	Roller.	Doubling.	Heating.	Catcher.	Shearing on jaw or crocodile shears, and job or sheet work.	Shearing tin plate on squaring shears.	Screw boy.
8 to 11	$1.71	$0.97	$0.98	$0.59	...	...	...
12 and 13	1.97	1.00	1.03	.62	$1.26	...	...
14 and 15	2.07	1.16	1.23	.71	...	$0.41	$0.60
16 and 17	2.77	1.58	1.52	.95	...	...	...
18 to 20	3.10	1.77	1.70	1.06	1.44	...	...
21 to 24	3.72	2.19	2.02	1.17	...	.50	.73
25 and 26	3.94	2.30	2.22	1.24	1.31	.51	.80
27 and 28	3.99	2.43	2.40	1.25	1.22	.53	.81
29 and 30	4.19	2.76	2.68	1.43	1.01	.52	.81
31	4.28	2.91	2.86	1.45	.97	.55	.82
32	4.47	3.06	3.01	1.52	1.00	.55	.84
33	4.76	3.22	3.10	1.60	1.03	.59	.86
34	5.29	3.44	3.39	1.78	1.20	.61	.89
35	5.54	3.62	3.60	1.88	1.20	.63	.99
36	5.91	3.72	3.74	2.00	1.25	.66	1.02

44	7.43	5.69	5.75	2.50	1.55	.79	1.24

FOOTNOTES.

1. Twenty (20) per cent. added for changed iron and steel.

2. Seventeen (17) per cent. added for pickle finished iron and steel, except shearman.

3. All iron or steel rolled on tin or black plate mills sheared to patterns of irregular shapes or circles, shall be paid for at the weight of the square sheet.

4. All plates and sheets cut down to smaller sizes of tin plate mills to be paid for at scale prices.

5. That all sheets or tin plates 14 square feet and over, when finished in six or more sheets to the pack, shall be paid for at the following rates above tin plate scale: 10 per cent. extra on 26 gauge and heavier, and 20 per cent. for all lighter gauges up to and including 32 gauge, and for all sheets or tin plate 15½ square feet and over, finished in fours, the same percentage shall apply, and it is understood that when plates worked on a tin mill less than the above superficial square feet are not first pickled, annealed, cold rolled and thoroughly treated as plate for tinning purposes before leaving the mill where they are worked, the above percentage shall apply. This does not include shearman, as his wages for sheet work is based on jaw or crocodile work. All black plate orders to be marked on the bar when brought to the mill.

6. Where improved squaring shears are used the company shall pay for opening packs and grinding the knives, and on jaw and crocodile shears the company to pay for opening packs, and in mills where plates are cut into 14 x 20 inches or smaller sizes, additional pay shall be arranged as follows: For four (4) or five (5) cuts, 10 cents per ton above scale price shall be paid, and 5 cents per ton additional for each extra cut thereafter.

7. Eight (8) hours shall be a day's work on tin or black plate mills, said mills not to follow out, only on Friday and Saturday, when a full turn's work shall not be made in less than seven (7) hours, when due notice shall be given of such change.

8. It is agreed that no more than three changes in the classification of sheet and tin plate mills can be made during the scale year, and due notice shall be given before such changes.

9. The weight of the bar to be marked on the bar when brought to the mill, and scales for weighing bars be furnished.

10. In each tin mill a blackboard shall be furnished, on which the complete weight of each turn shall be placed within a reasonable time after being made.

11. All tin and black plate shall be weighed by the company after being sheared and opened.

12. That the company furnish soft grease on Monday and any other warming up turns.

13. That all men working under the control of the Amalgamated Association shall not wait in the mill longer than three (3) hours without working.

14. Three (3) turns to constitute a day's work for shearman, except in case of accident or other contingencies.

15. Where a shearman feeds his own pack no deduction shall be made from his wages. When the scrap boy feeds the pack, 10 cents per turn shall be deducted, except in cases where mill construction or placing of shears prevents.

16. That all mills working iron or steel over 32 inches wide be classed as large mills, and ten (10) per cent. extra shall be paid for all such widths over 32 inches wide up to 35 inches wide; for 35 inches wide and over, containing less than 14 square feet, 20 per cent. extra shall be paid.

17. All crop ends shall be paired in equal lengths and, when possible, equal weight.

18. The standing turn and level hand men on tin mills shall receive their money direct from the company.

19. That ten (10) per cent. extra shall be paid for spreading bars.

20. That all iron and steel worked on tin mills, finished in eighths heavier than 27 gauge, be paid for at the same rate as 27 gauge.

21. That there shall not be any making up of lost weight on tin or black plate mills on a turn where crews are obliged to follow out or give up the mill in less time than seven hours.

22. That all cut downs be marked separately on board.

23. That where they have patent feeders on shears, the shearman to be paid 10 cents per turn extra, and shearmen shall not use wrench or any other implement to assist feeder in its work, except it be operating treadle. Eight hours shall constitute a day's work for shearmen.

OUTPUT SAME AS LAST YEAR.

1. Where 28 gauge is worked, in six or eight sheets to the pack, 6150 pounds shall be the limit.

2. On sizes 20½ x 56 an excess of 5 per cent. may be made, but on sizes less than 20 inches wide the per cent. cannot be made.

3. Turns below the limit may be made up during the same week for that week, but in making up lost weight on any turn, the output shall not exceed the limit over 500 pounds on 31 gauge and heavier, and 250 pounds on lighter gauges, and, when the drawback is made, the percentage excess cannot also be made on same turn.

4. When a turn's work is made within fifty (50) pounds of limit, it shall be considered a full turn, and the company cannot insist on the making up of said shortage.

The base weights to remain as in scale book, with the exception of 30 and 31 gauge minimum, which shall be 101 and 91 respectively.

THE E. W. BLISS COMPANY, Brooklyn, N. Y., have prepared a neat little pamphlet for distribution at their exhibit at the Pan-American Exposition, Buffalo, N. Y., which illustrates some of their leading lines of Presses, Dies, Shears and Sheet Metal Working Machinery. A view of the company's big machine shops is given, and the statement is made that their forge shop is now completed and that they are prepared to correspond with those who desire Die or other Forging of the highest order.

The Sheet Mill Situation.

On Saturday, June 29, every sheet mill owned by the American Sheet Steel Company shut down for an indefinite period, owing to the fact that the American Sheet Steel Company refused to sign the Amalgamated scale for the sheet steel mills at Wellsville, McKeesport, Kirkpatrick mills at Leechburg, Scottdale Iron & Steel Company at Scottdale, and the Apollo Mills at Vandergrift. At a conference of the wage committees representing the American Sheet Steel Company and the Amalgamated Association, held in Pittsburgh on Saturday, June 29, the sheet scale was satisfactorily arranged until it came to the signing of it. Persifor F. Smith, who represented the American Sheet Steel Company, absolutely refused to sign the scale for the five mills named above, claiming that they were nonunion, had been for years, and that it was unfair of the Amalgamated Association to ask that the scale be signed for these mills. On behalf of the Amalgamated Association, Theodore J. Schaffer, president, stated that employees of union mills would not be allowed to work until the scale had been signed for all the mills owned by the American Sheet Steel Company. The question at issue, therefore, is not one of wages, but of recognition of the Amalgamated Association in nonunion mills of the American Sheet Steel Company.

Before the American Sheet Steel Company were organized a number of the most important sheet mills in the country ran nonunion and had done so for many years. Among those were the plants of the Apollo Iron & Steel Company at Apollo and Vandergrift, the W. Dewees Wood Company at McKeesport, the Wellsville Plate & Sheet Steel Company at Wellsville, Ohio; the Scottdale Iron & Steel Company at Scottdale and the Kirkpatrick Company of Leechburg. After the American Sheet Steel Company were organized the officials of the Amalgamated Association at once went to work to organize lodges among the employees of the plants named above, and succeeded in getting a great many of the employees of the W. Dewees Wood Works at McKeesport, the Apollo at Vandergrift, the Kirkpatrick Mills at Leechburg and the Scottdale Mills at Scottdale to affiliate themselves with the Amalgamated Association.

It will be recalled that two or three months ago labor troubles broke out in the W. Dewees Wood Company Works at McKeesport, but the matter was arranged by the Amalgamated Association agreeing to allow the mill to be operated as before until the expiration of the scale year, on June 30. The Amalgamated Association evidently intends to strengthen its position among the sheet mills, by attempting to make all the mills of the American Sheet Steel Company union. Whether this can be done remains to be seen. It is a fact, however, that the trouble among the sheet mills comes at an unfortunate time for the American Sheet Steel Company, as the demand for black and galvanized sheets is enormous and has filled the mills up with tonnage for the next three or four months. At the present time there is not a sheet mill owned by the American Sheet Steel Company in operation, but it is possible the trouble, which now has a very serious aspect, may be fixed up before this week is out. Neither side desires a long conflict, but, if respective positions are maintained, the sheet mills promise to be idle for an indefinite time.

The mills outside of the American Sheet Steel Company in the Central West which can be operated are those of Zug & Co., Limited, of Pittsburgh; the Whitaker Iron Company at Wheeling, W. Va.; the Wilkes Rolling Mill Company at Sharon, Pa., and the Niles Iron & Steel Company, Niles, Ohio. The last named concern completed their works only a short time since and are operating a three-mill plant. Zug & Co. have six mills, the Wilkes Rolling Mill Company two mills, and the Whitaker Iron Company six mills. However, most of the output at the latter concern is used by the Wheeling Corrugating Company, an identified interest. It will be seen, therefore, that if the shut down of the sheet mills should continue for a prolonged period there would be a famine in sheets. There has been an enormous consumption for months, and stocks in the hands of jobbers all over the country are very low. In the meantime those having sheets to sell will probably either hold off, or else quote very much higher prices. In the East are quite a number of sheet mills that do not sign the scale and these will be operated right along, and, of course, will profit by the suspension of the mills in the West.

T. J. Shaffer, president of the Amalgamated Association, has given out the following statement relating to the trouble with the sheet mills:

"Much as I regret to make the statement, I must say that it seems to be a premeditated blow at organized labor. In the first place, Persifor F. Smith, who had absolute authority for the sheet steel combine in our conference, has for the last 20 years been one of the strongest advocates of nonunion labor. I will do Mr. Smith the credit, however, to say that he acted fairly and above board with us.

"It is but fair that the people should know the inside doings of the Saturday conference. When Mr. Smith presented to us an impossible proposition regarding those two mills, a proposition which he knew was impossible, I saw the trend of affairs. I told him it was 20 years since he had begun personally to antagonize the Amalgamated Association and union labor, and asked him whether the association was not much better and more worthy of consideration now than then. He admitted such was the case. I asked if it were not true that he had the opinion that the nonunion mills working at a lower rate of wages were in more satisfactory condition than the union mills. If this was the case I wanted to open the subject to debate, but Mr. Smith absolutely refused to debate the matter at all. He refused to do anything, but insisted that the Old Meadow and Saltsburg plants be eliminated from the union scale. Nothing was said about the McKeesport plant. This left me no alternative, so I simply said to Mr. Smith:

"'As representative of the American Sheet Steel Company you have thrown down the gauntlet to organized labor, and as president of the Amalgamated Association I now take it up. It will be a fight to the finish.'

"So far as I can see, there is no possible chance for another conference. Certainly we will not consider any such absurd proposition as that offered by Mr. Smith. I had hoped there would be no trouble between the workmen and the employers, but they have forced it. I have been abused many times by those I thought my friends because I did not go out and stir up trouble, for there are those who hate peace. I will now say what I said to Mr. Smith in the conference, 'If it is to be a strike, we will make it one to be remembered.' The officials now dealing with us have but little idea of the extent to which this strike will go, once on."

The mills owned by the American Sheet Steel Company, and which have closed down on account of the trouble, are as follows:

Ætna-Standard Iron & Steel Company, Bridgeport, Ohio.
Apollo Iron & Steel Company, Vandergrift, Pa.
Cambridge Iron & Steel Company, Cambridge, Ohio.
Canton Rolling Mill Company, Canton, Ohio.
Chartiers Iron & Steel Company, Carnegie, Pa.
Chester Rolling Mill Company, East Liverpool, Ohio.
Corning Steel Company, Hammond, Ind.
Coshocton Rolling Mill Company, Coshocton, Ohio.
Dennison Rolling Mill Company, Dennison, Ohio.
Dresden Iron & Steel Sheet Company, Dresden, Ohio.
Falcon Iron & Nail Company, Niles, Ohio.
Hyde Park Iron & Steel Company, Hyde Park, Pa.
Kirkpatrick & Co., Leechburg, Pa.
P. H. Laufman & Co., Paulton, Pa.
Midland Steel Company, Muncie, Ind.
New Philadelphia Iron & Steel Company, New Philadelphia, Ohio.
Old Meadow Rolling Mill Company, Scottdale, Pa.
Pittsburgh Sheet Mfg. Company, Shousetown, Pa.
Piqua Rolling Mill Company (Cincinnati Corrugating Company), Piqua, Ohio.
Reeves Iron Company, Canal Dover, Ohio.
Republic Iron & Steel Company's sheet mills, outside of Alabama.
Saltsburg Rolling Mill Company, Saltsburg, Pa.
Scottdale Iron & Steel Company, Scottdale, Pa.
Struthers Iron & Steel Company, Struthers, Pa.
Sharon Iron Company, Sharon, Pa.
W. Dewees Wood Company, McKeesport, Pa.
Wellsville Plate & Sheet Iron Company, Wellsville, Ohio.
West Penn Sheet Steel Company, Leechburg, Pa.

The above plants contain from 275 to 300 sheet mills, and their output is between 2000 and 2500 tons of sheets per day.

SHARON TIN PLATE COMPANY.

The Sharon Tin Plate Company of Sharon, Pa, are a constituent interest of the Sharon Steel Company, and were organized a short time after active work was started on the Sharon Steel Company plant. The original tin mill was designed to contain ten mills, and before these were finished the entire product of tin and terne plate was sold to the American Tin Plate Company for a term of five years, the price to be the regular market price of tin plate. This is probably the first case in the manufacturing business where the concern have been able to sell their prospective entire output at a very high price and for a period of years. This contract was made in order that the output of the Sharon Tin Plate Company would not come in competition with the American Tin Plate Company. A short time before this contract was made with the American Tin Plate Company the Sharon Tin Plate Company decided to double their plant by the building of ten more mills, and these are actively under way and will probably be ready for operation in the latter part of the year.

The hot mill building is 900 feet long by 108 feet wide and is equipped with two 20-ton electric cranes. All doubling and squaring shears are run by electric power. This building contains ten 26-inch hot tin mills, which are completed and running, and ten more building. Of these mills one has rolls 34 inches wide, one 36 inches wide, eight 32 inches wide, while the ten that are building will be 30 inches wide. The furnaces completed are 12 sheet furnaces and ten pair furnaces. There are also ten additional sheet and ten additional pair furnaces in course of erection. These furnaces are all fired with producer gas. Power for the first ten mills is furnished by a Buckeye compound condensing engine, furnished by the Buckeye Engine Company, Salem, Ohio. Power for the second ten mills will be furnished by a compound condensing engine, furnished by Mackintosh, Hemphill & Co. of Pittsburgh. The steam for these mills will be furnished by five 400 horse-power Wheeler boilers in boiler house No. 1, and three of the same type in boiler house No. 2, all furnished by the Wheeler Boiler Company of Sharon, Pa.

The cold mill is 520 feet long by 88 feet wide and is equipped with five annealing furnaces, and one building of 50 tons capacity for 12 hours. These furnaces will be equipped with Swindell chargers and one 20-ton crane. There are 13 stands of cold rolls, 12 driven tandem and one for one-pass 24-inch rolls.

The black pickling room is 72 x 90 feet in size, and is equipped with two Mesta pickling machines, furnished by the Mesta Machine Company of Pittsburgh. The white pickling room is 72 x 128 feet and is equipped with one Mesta machine. The tin house is 72 x 212 feet and is equipped with 24 sets of doubling machines. The assorting room is 72 x 128 feet. Warehouse No. 1 is 160 x 72 feet. Warehouse No. 2 is 160 x 72 feet. Machine shop 60 x 60 feet and blacksmith shop 40 x 60 feet. There is a power house 80 x 40 feet equipped with two 250 horse-power Buckeye cross compound engines, direct connected to two Westinghouse generators of 200 kw. each.

The tin bars used in the mill are brought over by track from the tin bar mill of Sharon Steel Company and are taken direct to the reheating furnaces. The entire tin mill from beginning to end has modern equipment throughout, and the process of making tin and terne plate is continuous, there being no rehandling of material whatever.

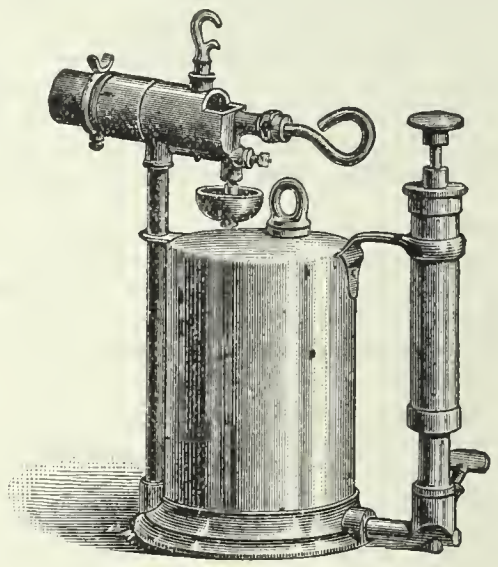
ED. S. BURGESS, president and general manager of the Burgess Soldering Furnace Company, Columbus, Ohio, left on July 2 for a ten weeks' sojourn at his summer residence, located on Columbus Beach, Indian River, Mich., where the latch string will always be out for any of his friends who may be within 50 miles of the place during that interval.

The Parkersburg Iron & Steel Company.

The Parkersburg Iron & Steel Company, whose general offices are in the *Times* Building, Pittsburgh, are making good progress in the work of erection of their four-mill sheet plant, at Parkersburg, W. Va., and expect to have it in operation in September or October. The main building is 120 feet wide by 450 feet long, which will accommodate a 12-mill plant, the concern expecting to increase to that number of mills in the near future. The four mills will be driven by a 32 and 58 by 60 cross compound Corliss engine, furnished by the Bass Foundry & Machine Company of Ft. Wayne, Ind. The firm are also installing four Wood direct fire 250 horse-power boilers and one Cahall 250 horse-power waste heat boiler. There is already in operation at the plant a Skinner engine and Bullock dynamo of 100 kw. capacity, which operates a Pawling & Harnischfeger electrical traveling crane. This dynamo also furnishes the motor power and light necessary for the operation of the plant. The boilers are to be shipped this week, and the high pressure cylinder for the engine is on the way, as well as the four mills. In addition to the main building there is a bar mill building 63 x 100 feet and a boiler house 63 x 90 feet. The firm will install a bar mill and roll their own sheet bars. The plant will be equipped with entirely new machinery with very few exceptions, and labor saving machinery throughout, and is expected to be a modern up to date sheet plant. The initial capacity will be from 12,000 to 15,000 tons per annum and the product will consist of the finer grades of sheet iron for stamping purposes and specialties.

The Quick Meal Paint Burner.

The Ringen Stove Company, 410 to 414 North Sixth street, St. Louis, Mo., have just brought out the Quick Meal paint burner or painters' lamp, of which an illustration is shown herewith. The main features to which special attention has been given are simplicity and durability, combined with a low price. The body of the tank is constructed of heavy brass drawn out of one sheet, which makes it very strong. The bottom is composed of cast brass securely fastened to the body. All parts are made of brass except the pipe leading to the burner. The air pump is contained in the handle and is of exceedingly simple construction. An air valve below the pump confines the air in the tank after being pumped up. The handle of the needle valve is formed in the shape of a loop. When hot it may be operated by inserting through the loop a screw driver or other tool. The burner throws a powerful flame from 6 to 8 inches long. The hook and notch on top of the burner are designed to hold a soldering iron. This enables the lamp to be used not only by painters, but also by plumbers, tinners or other workmen who need a torch to throw a powerful flame. It is stated to be an ideal burner for thawing frozen water pipes, and that while the device is exceedingly light, yet it is constructed so as to make it very durable. The lamp has been the subject



The Quick Meal Paint Burner.

of thorough experiment with the company, who claim that it is a decided improvement over the usual lamp or torch of this character.

FLASHINGS.

THE SUMMIT ROOFING COMPANY of New York City have been incorporated, with a capital of $10,000, by G. J. Geer, S. H. Ordway and W. A. Gommell.

THE DETROIT GALVANIZED SHEET & METAL WORKS, Detroit, Mich., are about to add a Tin Can factory to their manufacturing plant.

THE Sheet mill plant of Marlin & Co., at Thirtieth and Smallman streets, Pittsburgh, Pa., was partly destroyed by fire last week, the damage to the building and equipment being estimated at about $6000.

THE AMERICAN ROLLING MILL COMPANY of Muncie, Ind., and the Tin Plate works of the W. H. Griffith Company, at Washington and Waynesburg, Pa., have signed the Amalgamated Association wage scale.

THE TYLER CAN COMPANY of Baltimore, Md., have been incorporated by George M. D. Tyler, George M. D. Tyler, Jr., George F. Flemming, Samuel Parsons and Lindley M. Huggins, with a capital stock of $5000, for the purpose of manufacturing articles made of Tin and other Metals.

THE SENTENNE & GREEN COMPANY, with principal office at 228½ Montieello avenue, Jersey City, N. J., have been incorporated, with a capital stock of $250,000, by George F. Maguire, Ernest H. Ball and Robert R. Ball. The company will manufacture Tin Cans, Metal Signs, &c.

THE BROOKLYN METAL DECORATING PLANT have been incorporated, at Brooklyn, N. Y., with a capital of $5000. The directors are: George Meier, Mt. Vernon, N. Y.; E. A. Emerson, New York, and E. B. Barnum, Brooklyn.

THE site of the American Sheet Steel Company's old plant in Sharon, Pa., will shortly be utilized for the erection of a mill of another description, say the Sharon papers.

E. K. SOBER has resigned as manager of the American Sheet Steel Company's plant at Canton, Ohio. He is succeeded by Mr. Ward, manager of the company's Cambridge, Ohio, plant.

HUGH ANDERSON, formerly master mechanic of the Hazleton Works of the Republic Iron & Steel Company, Youngstown, Ohio, but who has accepted a similar position with the Youngstown Iron & Steel Roofing Company, was presented with a gold watch chain and charm by the employees of the Hazleton works.

W. VERNON PHILLIPS of F. R. Phillips & Sons Company, Philadelphia, builders of Tin Plate machinery, has sailed for Liverpool on a business trip in the interests of the firm. He will go to Wales and the Continent, returning about September 15.

THE AMERICAN SHEET STEEL COMPANY have at the present time 21 Sheet mills in the Vandergrift Works, at Vandergrift, Pa.; ten mills in the Leechburg Works, at Leechburg, Pa.; four mills at the Saltsburg Works, at Saltsburg, Pa., and six mills in the Apollo Works, at Apollo, Pa. It is the intention to add eight more mills to the Vandergrift Works, making that a 29-mill plant. All these mills are in charge of E. W. Pargny, who is manager for the Pittsburgh district for the American Sheet Steel Company. The equipment at the Leechburg Works has been very much improved, and has been brought up to the best possible sheet practice. The equipment at the above four works is kept in the best possible condition by a large force of millwrights and machinists, that a shut down in the summer for repairs is not necessary. At these works the Amalgamated scale is not signed, and the mills are all in full operation, despite reports to the contrary.

THE WHEELING STEEL & IRON COMPANY of Wheeling, W. Va., have signed the Amalgamated Association scale.

AT a recent meeting of the directors of the stockholders of the Youngstown Iron Sheet & Tube Company, Youngstown, Ohio, the officers were instructed to take the necessary steps to increase the capital of the concern from $1,000,000 to $2,000,000, having in view the necessity for enlarging the present plant of this concern, which is now being built. While it may be necessary a little later to erect a steel plant, yet this concern do not expect to do so at once, and will not, unless necessary to provide themselves with Rod material. Contracts for the building of the works of this concern have about all been placed and the work of construction is being pushed as fast as possible. The initial plant will consist of puddling, Muck Bar, Skelp, Tube and Sheet mills. The concern propose to make Iron Tubes and Iron Sheets exclusively, and will do their own puddling. They expect to be in the market late in the year with their product.

TRADE NOTES.

THE NUNN BRASS WORKS of Rochester, N. Y., have been incorporated with a capital of $4000, Lorasso Field, A. W. Nunn and Elizabeth R. Booth of Rochester being the directors named.

THE COLUMBIA LEAD COMPANY, St. Louis, Mo., have increased their capital stock from $500,000 to $600,000.

THE BURGESS SOLDERING FURNACE COMPANY of Columbus, Ohio, are running their plant night and day to keep up with their orders. A patent on a new Gas Heating Stove has just been granted them, which will be placed upon the market during the coming fall season.

WE are indebted to Baker & Co., 408-414 Railroad Avenue, Newark, N. J., for a sample of a neat little dating stamp which they are sending out to their customers, also a notebook bound in a white celluloid cover, which in addition to information regarding the company's goods, consisting of Platinum Sheet and Wire, has tables of weights and gauges of Platinum, also a comparative table of troy, avoirdupois and French weights, tables of specific gravity of various metals, and other useful information. A number of blank pages are left for notes.

A CIRCULAR letter issued by the Buffalo Specialty Mfg. Company, Buffalo, N. Y., incloses a leaflet illustrating and describing the company's Success Emery Grinder for foot power, which is claimed to have special merits, 3000 revolutions per minute being easily obtained. The machine is 4 feet high and is arranged for attachment to the floor and wall. As an inducement to the trade to purchase, the company are offering to send out free of charge one-half dozen of their Steel Solid Leather Handled Screw Drivers in assorted sizes with each of the Grinders shipped in response to orders.

THE Emery syndicate, composed of four firms which practically control the Emery industry of this country, took hold of the business on July 1. The capital of the syndicate is $400,000 and the officers are: Lewis R. Speers of Boston, Mass., president; Albert Sandt of Easton, Pa., treasurer, and John West of Perth Amboy, N. J., secretary.

THE AMERICAN METAL COMPANY, LIMITED, of New York, have filed with the Secretary of State of New York a certificate of an increase of the capital stock of the company from $1,000,000 to $1,500,000.

THE HEANY COMPANY, galvanizers of iron, 46 and 48 North Morgan street, Chicago, have just completed the erection of a new brick building, 40 x 100 feet. This will be used as a Galvanizing plant and will materially increase the capacity of the works.

IT is reported that the enamelling works at Duquesne, Iowa, have been sold to New York and Chicago capitalists and that manufacturing operations will be conducted on a larger scale than heretofore.

WILLIAM B. SCAIFE & SONS of Pittsburgh, manufacturers of Structural Iron Work, Pressure Tanks, Galvanized Ice Cans, Sheet Plate and Forged Iron Work, have secured a contract from the Mexican Central Railroad for a large Galvanized Cylinder, on which a steel frame pier is to rest. The contract necessitates an enlargement of the galvanizing plant of William B. Scaife & Sons. These Cylinders, which are to be galvanized and then riveted together, are 6 feet in diameter, made of ⅝-inch thick steel, each weighing about 2800 pounds. They are to act as piers, and when put in place will be filled with concrete. They are the largest Cylinders that have ever been galvanized in this country, and it is

doubtful if anything as large has ever been galvanized elsewhere. This firm did similar work for the Port Royal Navy Yard wharf last year, but the Cylinders were only 4½ feet in diameter, made of ⅜-inch, and weighed 1100 pounds each.

The Molders' Conference.

A conference was held at the Sherman House, Chicago, on Tuesday, July 2, between committees of the National Foundrymen's Association and the Iron Molders' Union of America to establish the wage scale for the ensuing year. The former was represented by Geo. Q. Thornton, St. Louis; I. H. Reynolds, Milwaukee; H. S. Hodge, Detroit; H. J. Gosiger, Cincinnati, and W. A. Jones, Chicago. The Molders' Union was represented by Martin Fox, M. J. Kehoe, David Black, W. J. Phillps and John Campbell. The old scale was $2.50 minimum for bench molders and $2.75 for floor men. The molders first asked $3 flat. They modified their demand to $2.85 per day minimum for floor and bench molders for Chicago and vicinity. This was refused by the foundrymen, who offered $2.85 for floor molders and $2.65 for bench molders. This not being accepted by the molders, further consideration was postponed until July 10, the molders meanwhile remaining at work.

Electric Fire Hazard.

Edward Atkinson, president of the Boston Manufacturers' Mutual Fire Insurance Company, calls attention to the occurrence of fires directly traceable to electrlcity and summarizes the general conclusions for this experience as follows:

Any plant installed ten years or more ago will, in nine cases out of ten, come under what we may call the "wooden age" of electrical work—that is, when the switchboards, cleats, rosettes, celling buttons and cut outs were all more or less of wood; this class of fittlngs offers very little resistance to heat caused by arcing or by poor contacts. In inspecting a system where all the above named parts are of porcelain, it is falr to conclude that it is a modern Installment and probably safe. On the other hand, all plants put in during the "wooden age" must be regarded with suspicion; they may be found in many respects defective, and may also have been subject to a greater measure of wear and tear than the plants which have of late been established. It may often happen that, while the wiring may need renewing, the switchboard may be safe, or *vice versa;* again, that both the wiring and switchboard may be passed, if the fittings are renewed. It would therefore be well, if any radlcal changes are advised, to consult the underwriters, who will then make an immediate inspection. It is the conviction of the adjusters and experts, by which the increasing number of very heavy losses in the general practice of underwriting are appraised, that a large and Increasing part of the great fire waste in the last two or three years may be attributed to electric hazard.

To Weld Copper.

In the *Record* of the University of Tennessee, Professor J. R. McCall gives the following directions for welding copper. The copper should be treated with potassium nitrate and a cyanide, after which it is welded to itself, or to iron or steei, in the same way that iron is welded in the ordinary forge shop. A clean fire of coke or charcoal and a temperature of the copper considerably below a white heat insures the best results. A temperature above this makes the metal brittle in working, while one much below would not give sufficient fluidity to the flux. In teasion tests the welded joints devcloped practically the whole strength of the copper.

Charles M. Schwab, president of the United States Steel Corporation, recounts this experience. Recently he came to Braddock to make an inspection of the Edgar Thomson plant. A buggy with a colored driver was awaiting him at the station. He had just settled down into his seat beside the negro when he overhead a working woman calling to her boy: "Look, look, Johnnie, there is the famous Mr. Schwab!" The boy glanced at the occupants of the buggy, and then turned to his mother with the question: "Which one?"

Fire Test of Wire Glass.

Wire glass windows and standard fire shutters of two different makes were recently subjected to three interesting tests in New York, nnder the supervision of the city Building Board, and in presence of several insurance men, with a view to showing the relative efficiencies of each. An expert insurance company's inspector who was present is quoted by *Fire and Water* as drawing the following conclusions from the tests: "The first test was unsatisfactory, for the reason that it is an open question whether or not the excelsior mattress in the test structure snbjected to an exterior fire was ignlted by radiation or by sparks coming through the only partly closed ventilators under the roof. Judging from the low temperature of the outer glass while the interior fire was in progress, it is hard to conclude that radiation lgnited the mattress. The other tests, the fire in the third being interior, were entirely satisfactory, and demonstrated that wire glass, when in approved frames similar to those used in these tests, is more reliable than the common iron shutters, and in many cases is capable of taking the place of standard shutters, provided that in windows over roofs, or when exposure is within, say, 15 feet of the risk, or when openings are in interior division walls, the panes of glass are double, with air space between. Even the double sashes, however, can hardly be considered the equal of the standard tin clad wooden shutter, on account of the chances of warping, the radiation of heat, and the chance of breakage by falling walls, &c. From other tests it has been shown that inflammable material should be kept at a distance of about 4 feet from the window when single panes are used, and at about 15 inches, with double-ventilated panes. The softening point of wired glass is claimed to be about 3000, a temperature seldom reached by an exposing fire—while the melting point of ordinary window glass is from 800 to 1000."

To Clean Rusted Iron Work.

An ingenious method of cleaning rusted iron work is suggested in an English exchange, which is specially applicable to articles which cannot be filed or ground, or which have recessed parts difficult to get at. The process has the merit of slmplicity. Attach a piece of ordinary zinc to the iron work, then immerse the whole lnto water in which is a little sulphuric acid. Let them remain for several days, when the rust will probably have disappeared. If, however, the article is badly rusted a little more acid may have to be added. It is necessary that the iron and zinc be in good electrical contact, bonnd together with wire, or it will answer if a piece of battery zinc is connected up to the iron with a piece of iron wire tightly wound ronnd. If the rust is only superficial it will suffice if a piece of galvanized iron is wonnd round the article, the galvanized surface, being zinc, proving sufficient for the purpose. The iron is not attacked by the acid while the zinc is in proper contact. The article will come out a grayish black color and should then be washed and oiled.

The Census Bureau has issued a bulletin giving the statistics of manufactures for the State of Delaware. The bulletin places the total gross value of manufactured products for the State at $45,387,630, an increase of 20.8 per cent. over the value of such products for 1890. The number of establishments in 1900 was 1417; the capital invested, $41,203,239; average number of wage earners, 22,203; total wages paid, $9,263,661; cost of material used, $26,652,601. The net or true value oi products is given at $29,573,449, the value of materials purchased in a partly manufactured form being $15,864,041.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

TROUBLE WITH PATTERN FOR SHIP'S VENTILATOR.

From J. B., San Francisco, Cal.—I have one of your pattern books, from which I have studied the pattern for the ship's ventilator. I have tried every possible way to work the problem out for myself, but do not seem able to succeed. I send you herewith one of my drawings and hope you will be able to discover the cause of my failure.

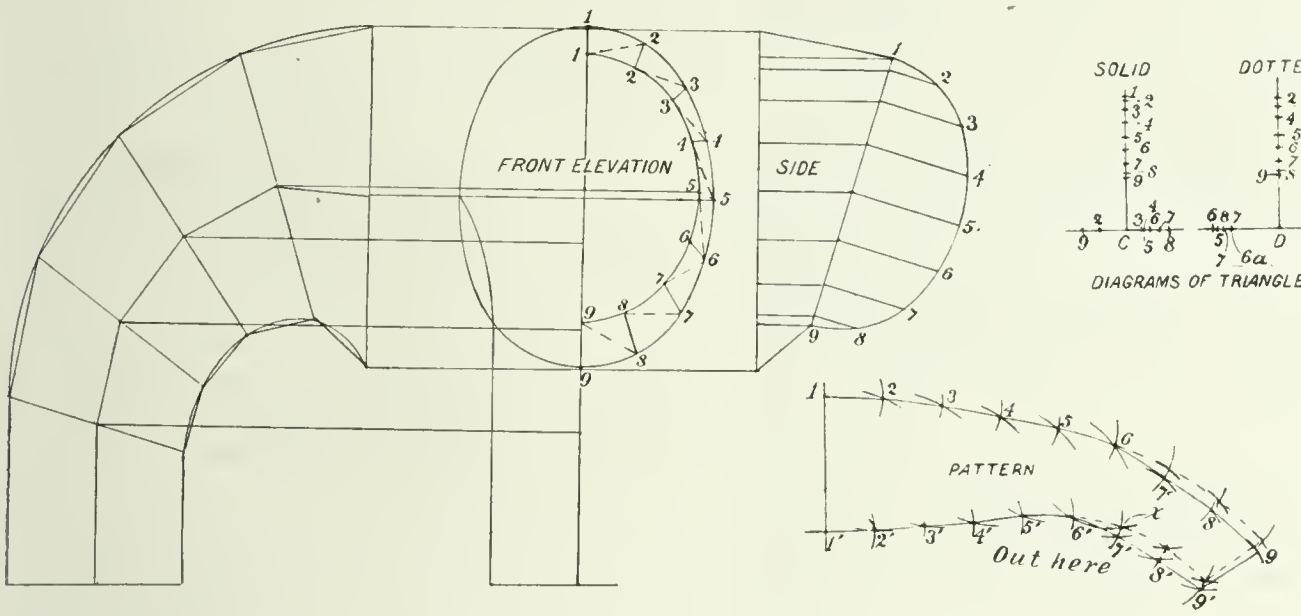
Answer.—We are in receipt of many communications from readers asking how to develop certain patterns, but it is seldom that the inquirer sends in his drawing with the request to point out his errors. Our correspondent's action in the matter is to be commended, as by so doing we are enabled to see at once just where his error occurred and thus render him the assistance desired. He does not state whether his "pattern book" is one of our latest issue, entitled "The New Metal Worker Pattern Book," or a copy of the older book bearing a similar title. At the bottom of the first column of page 91 of the new work it is stated that "The operations of triangulation undoubtedly require more care for the sake of accuracy than those of any other method of pattern cutting, for the reason that there is no opportunity of stepping off a continuous stretchout, at once, upon any line either straight or curved. . . . Triangulation is not introduced as an alternate method, but as a last resort, when nothing else will do."

This is intended as a warning to the pattern cutter to exercise the greatest care in the operations of triangulation. The errors into which he can fall are mainly of two kinds—viz.: (1) Inaccuracy in taking the various measurements required in developing the pattern, and (2) the taking of wrong measurements arising from confusion where several points come very close together, as in the diagrams of triangles where some of the measurements differ but slightly from those next in order.

In the accompanying illustration we show a *facsimile* reproduction of our correspondent's drawing, to which, however, we have added a correction of his pattern in dotted lines and a correction of some of his numbers, shown by the long leaders in the diagram of triangles marked "dotted." His principal error belongs to the second class mentioned, but is caused by a change in the direction of the oblique measurements after points 6 and 6′ of the pattern have been reached. In constructing his diagrams of triangles he has set off the vertical hights of the several points in the upper or smaller end of the section under consideration upon both the vertical lines in the diagrams of triangles, these hights being taken from the side at the right of the elevation. In the diagram marked "solid" he has set off from C on the horizontal lines the lengths of the several solid lines 2 2, 3 3, &c., of the front elevation, the numbers on the vertical line being supposed to represent the points in the smaller end, which, for convenience, we shall call the top, while those upon the horizontal line represent the points in the larger base, which we shall call the bottom. In the diagram marked dotted the lengths of the dotted lines, 1 2, 2 3, &c., connecting points of different number in the elevation, are set off from D upon the horizontal line and should be numbered to correspond with the points in the line of the bottom in the front elevation. In this operation our correspondent has made his first error.

In the division of the four sided figures produced by the solid lines 2 2, 3 3, &c., with the upper and lower lines of the elevation, a greater degree of accuracy is produced by drawing the dotted line so as to follow the shorter diagonal. Thus the diagonal drawn from 1 at the top to 2 at the bottom is shorter than one drawn from 1 at the bottom to 2 at the top. The direction here assumed holds good till the middle of the figure is reached, when the diagonal drawn from any point upon the top line to the point of next lower number at the bottom becomes the shorter. He has seen fit to change the direction of his dotted diagonal after passing the solid line 6 6. In this respect he has followed the precedent given in the pattern book, although, as will be seen by reference to the front elevation, he might with propriety have made the change after reaching the line 5 5. In setting off the length of the dotted line 6 7 of the elevation upon the diagram of triangles he has numbered the point on the base line 7, instead of 6, the number at its lower end. There should thus be two points 6 upon the base line, one representing the position of the point 6 at the bottom with reference to point 5 at the top, and the other representing its position with reference to point 7 at the top. In the same manner the lengths of the dotted lines 7 8 and 8 9 of the elevation have been set off from D of the diagram and have there been marked 8 and 9, the numbers of the top, when they should have been marked 7 and 8, the figures at the bottom ends of the respective lines. The correct numbers of the points in question are shown at the ends of the long leaders below the base line of the diagram.

This error in numbering the points is undoubtedly



Trouble with Pattern for Ship's Ventilator.—Reproduction of Diagrams Submitted by "J. B." of San Francisco, Cal.

responsible for the error in the pattern beginning at the point where our eorrespondent has written the words "out here." Barring slight inaeeuraeies of measurement the pattern is eorreet up to this point. After the points 6 and 6′ have been reached the next measurement to be transferred to the pattern is the distance from 6 at the bottom to 7 at the top. This measurement (the distance from 7 on the vertieal line to point 6*a* on the base line of the diagram) being used as a radius to describe an arc from point 6 of pattern as center would intersect the arc through 7′ at point *x*. As the length of the radius which has really been used in the pattern (6 7′) corresponds with the distanee from 7 ou the vertical line of the diagram to point 6 at the extreme left (the point whieh, as before stated, was placed there for use with point 5 on the perpendicular), it is evident that he has used that distance as a radius, instead of the distauce from 7 ou the perpendicular to point 6*a* on the base line of the diagram, which he has numbered 7.

The remaining two radii, eorresponding to dotted lines 7 8′ and 8 9′ of the pattorn, are approximately correct, although they correspond in length with distances which, according to his numbers, are 8 8 and 9 9 of the diagram marked "dotted."

If the point *x* be used, instead of the point 7′ of the pattern, from which to describe the are whose radius is 7 7, aud the remaining triangles be eonstructed as before, the pattern will then assume the shape shown by the dotted lines.

Tho reader will notice that he has not drawn the several hypotennses, to obtain which the diagrams are constructed. This is, of course, not necessary so long as the points of the compasses are placed on the correct points when measurements are being taken. The drawing of them and likewise the drawing of tho several solid and dotted lines corresponding to them across the pattern, however, will serve to keep before the eyes things which the miud may fail to retain unaided, and thus avoid an error.

Besides the grave error just considered, several smaller errors of the first class above mentioned are noted in the drawings which, owing to the reduetion necessary to bring the engravings into our columns, are not very perceptible. These inaccuracies may be pardonable iu the case of a person who is not used to making small drawings. The proportion of error thus incurred would no doubt be greatly reduced were the drawings made the full size of the work required.

Answers to other inquiries regarding this problem, which have been published in our issues of March 16 and May 21 of this year, may be of interest in this eonnection.

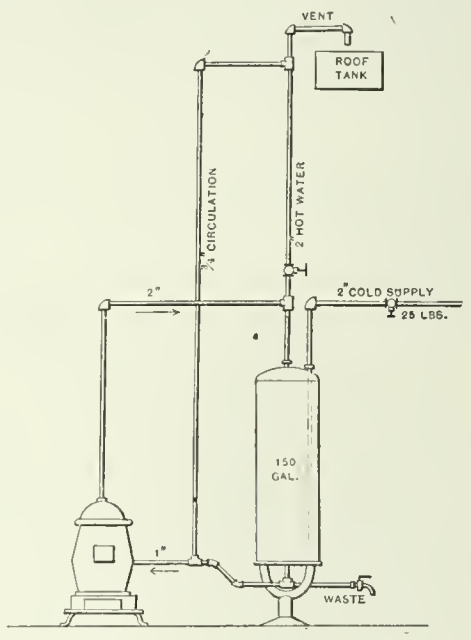
DOES THE OHIO LAW REQUIRE OUTSIDE AIR?

From the Peck-Williamson Company, Cincinnati, Ohio.—In answer to the inquiry of "G. R.," in *The Metal Worker* of June 29, we would say that there is no State law in Ohio requiring the air for school buildiugs to be takeu from the outside, nor is there any law which requires a change of air a given number of times per hour. However, in our eommon engineering practice, we figure on supplying 30 cubic feet of air per pupil per minute to the full seating capacity of the building, and always take this air from out of doors, at a point where it is least likely to be contaminated.

WHY DID THE HEATER BURST?

From Plumber, New York.—The explanation and sketch presented in *The Metal Worker* of May 25 by "A. B." do not show just how the work was done, and we submit herewith a correet sketeh, together with the circumstances attending the fitting up of this boiler. The boiler which is intended to be used permanently in this building is of 800 gallons capacity, but owing to delay in getting it, a temporary boiler was eonnected. The jaeket of the heater in the first instance showed a defect in the casting and another was substituted. After firing up, a second defect was found. The maker elaimed, however, that steam generated in the jaeket and drove the water out, letting the returning eold water cause the wrecking of the jaeket. We claim that sueh is not the case, as the sketch would show that if steam was generated, as the maker claimed, it would find vent at the roof tauk, as there was only 15 pounds pressure to overcome. The eold water pressure was 25 pounds. The capacity of the hot water storage tank was 150 gallous, and the heater had a 24-ineh fire pot.

Note.—We shall be glad if our expert readers will give their views in reference to the piping system whieh is presented as correct. It would seem that the slight differenee in piping would have no beneficial effeet over that whieh was shown in *The Metal Worker* on May 25, and that the views expressed in referenee to that piping system would hold good in this instance. Wherever the inlet pipe to a water heater is not as large as the outlet there is an opportunity for the boiler, when exeessively heated, to be cleared of water through the genera-



Why Did the Heater Burst?

tiou of steam, and when cold water rushes in to fill the vacuum the results are likely to be disagreeable, if not dangerous. It would have been better if, instead of using a 2-inch pipe from the top of the water heater, 1-inch pipe had been used throughout for the eonnection with the storage tank. It is just such little details that make or mar much work that is done.

A ROOFING PROBLEM.

From J. & C., Troy, Ala.—We have a roofing problem which we wish to solve, and if *The Metal Worker* will kindly give us the desired information we shall be thankful. The architeets through this seetion, in speeifying the method of putting on flat veranda and deck roofs, where 20 x 28 tin is used, require that it shall be put on flat, lock seamed and soldered on both sides and the same nailed to the sheathing. The question is, ean *The Metal Worker*, or any of its readers, tell us how it can be done in a skillful and workmanlike manner? We think we are practical roofers, but this gets ahead of us.

Note.—In some sections of the country, instead of flat seam roofing being put on a sheet at a time, the tin is prepared in rolls. Usually it is soldered on but one side, although it is often painted ou the under side. In applying the tin to the roof, a ½-inch edge is turned up along one side of the strip and turned down on the other. The strip is then fastened by nails beiug driven close in under the edge which is turned, and the eloser the nails are placed together the more easily and strongly the seam can be soldered. Tinned nails should be used for this purpose. It may be that the architects desire to have the tin put up in rolls for this class of work, and have the seams soldered on both top and bottom sides.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and unchanged in price.

Copper remains without change and in moderate demand.

Pig Lead is steady and strong.

Spelter is weak and dull.

Antimony shows no change.

Nickel is scarce and strong.

Aluminum is active and at former prices.

Tin Plates are in good demand and firm in price.

Black Sheets were reduced in price $4 per ton July 1, but retail quotations are unchanged; demand is heavy.

Galvanized Sheets are in heavy demand, and scarce; reduction of 5 per cent. in price by makers has not affected retail quotations.

Old Metals are dull and weak.

Foundry Pig Iron is quiet and unchanged.

Sheet Copper is fairly active and firm.

Plumbers' Supplies are very firm in price; business quiet.

Lead Pipe and Sheet Lead have stiffened ¼c. in price.

Wire Nails are moving in moderate volume—prices unchanged.

Cut Nails are without change and in fair demand.

Wire is very active and strong in price.

White Lead is quiet and firm.

Linseed Oil was further advanced in price 7c. per gallon; demand continues good.

Spirits Turpentine is about ½c. a gallon lower and dull.

Old Rubber is in good demand and prices are firm.

METAL MARKET.

Office of *The Metal Worker*, 232-238 William street, New York, July 5, 1901.

Pig Tin.—The market here has been inactive since our last report, with prices mostly in buyers' favor. On Wednesday prices took on a firmer tone, owing to an advance in London, due to a corner on spot Tin in that market. Owing to the extreme heat of the weather the New York Metal Exchange was closed from July 4 until Monday, July 8; consequently no quotations were made the latter part of the week. Retail prices have undergone no change, Straits Pig in small lots being quoted at 29¼c. to 29½c. per lb.

The following statistics for the month of June are published by the New York Metal Exchange: Arrivals at the Atlantic ports were good. Deliveries were the largest on record; the total for the first half of this year is 600 tons more than for the same time last year. The monthly shipments from the Straits were large. The increase in the Straits shipments to Europe and America during the first half of this year amounts to 2700 tons. The total statistics show a decrease of 2225 tons as compared with the previous month. The heavy decrease came through the writing off of 750 tons, representing the cargo of the wrecked steamship "Asturia." The total visible supply on June 30 is 5654 tons, or 436 tons below that of June 30 of last year.

Charles S. Trench & Co., New York, under date of July 1, 1901, print the following American Pig Tin statistics:

	Tons.
Estimated stocks on spot, New York, Philadelphia and Boston, June 1	1,326
Actual arrivals during June, New York, Philadelphia and Boston	2,886
Total	4,212
Estimated consumption during June	2,700
Esticated stocks on spot, New York, Philadelphia and Boston July 1	1,512
Actual afloat from East Indies, shipments to July 1	2,286
Actual afloat from England	220
Actual afloat from Holland	50
Total visible supply, July 1	4,068
As against June 1	5,427

Copper.—No change has taken place in this market, which has been very dull throughout the week, with prices unchanged and steady. Small lots of Lake Ingot are quoted at 17¼c. to 17½c. per lb., and Casting Copper at 16¾c. to 17c. The consumptive demand for Copper at the present time is of exceedingly moderate proportions.

Sheet Copper.—A good demand for Sheet Copper is noted, prices being unchanged on the basis of 21c. per lb. for moderate sized lots from store.

Pig Lead.—There has been no change of any kind in this metal. Prices continue firm, and the demand is of the usual proportions expected at this time of the year. Small lots of American Pig are quoted at 4.60c. to 4.62½c. per lb.

St. Louis advices are as follows: The demand for Pig Lead has been very strong for the past few days, and some good sized lots have been bought. The demand is from consumers entirely, there being apparently no speculation in the market. Higher prices are anticipated.

Spelter.—This metal is still dull and weak. Good Western brands in small lots are quoted at 4.45c. to 4.50c. per lb. In the St. Louis market there is not much doing, and prices show no variation from those of a week ago.

Sheet Zinc.—A fair demand at unchanged prices is reported for Sheet Zinc, jobbers quoting 600-lb. cask lots at 6¾c. per lb., and smaller quantities at 7¼c.

Antimony.—No change has taken place in this metal. Prices are steady; Cookson's in small parcels ruling at 10½c. to 11c. per lb., and Hallett's at 8¾c. to 9½c.

Nickel—Is strong and unchanged. Small lots are quoted nominally at 60c. to 65c. per lb.

Aluminum.—A steady and active demand keeps up for Aluminum, and prices are without change. Small lots of No. 1 Ingot, guaranteed over 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The situation in the Tin Plate market is without any change worthy of note. The signing of the Amalgamated Association scale by the Tin Plate mills is satisfactory to the trade, as removing the possibility of a prolonged shut down of the mills, with a consequent restriction of production. This contingency would have greatly complicated matters in the Tin Plate market, as the mills are a long way behind in their deliveries, and it will need pretty steady operation of the works throughout the summer to enable them to meet the requirements of the trade. The demand for Coke Plates, in particular, exceeds the output at the present time, and jobbers find it impossible to meet all the demands of their customers for this class of Plates. Prices are held very firmly in a retail way. Buyers are generally obliged to pay an advance over the market rates in order to secure prompt supplies. The retail trade in Tin and Terne Plates gives some indications of the arrival of midsummer dullness. The extreme heat of the past two weeks was reflected locally in material falling off in the volume of small orders. Jobbers are quoting American Bessemer Coke Plates, IC, 14 x 20, at about

$4.85 to 4.90 per box, and IX, $5.95 to $6, for moderate quantities, delivered at New York or corresponding points.

Sheets.—The surprise of the week in the metal market was the announcement by the American Sheet Steel Company of a reduction of about $5 a ton in the price of both Black and Galvanized Sheets, effective on July 1. This reduction was unexpected by the trade in the face of present conditions in the Sheet business. The explanation is given that the method is a part of the policy of the United States Steel Corporation to keep the prices of their products on as conservative a basis as possible. It may also be that the reduction is made partly with a view to heading off any large importing movement in Sheets that may have been in contemplation as a result of the shortage now prevailing, and of the possibility of a more or less prolonged suspension of a good part of the Sheet capacity, pending the agreement on the wage scale. It is obvious that the reduction could not possibly have been made with a view of stimulating business. As we have been reporting for some weeks past, the scarcity of Sheets has been becoming more marked week by week. Stocks are very light, and the manufacturers refuse to promise any deliveries on new orders within 90 days. The situation in the Sheet market consequently is an unsatisfactory one from the standpoint of dealers and consumers. It is not unlikely that an absolute famine in Sheets may occur within the next few weeks, although the non-union mills of the American Sheet Steel Company, and most of the independent concerns, are continuing operations without interruption. The demand for Sheets during the past week continued as active as ever, especially for Galvanized Sheets, which are even more scarce than Black. The reduction of prices by the American Sheet Steel Company has not affected jobbers' prices in this vicinity. Retail quotations continue the same as those ruling for the past few weeks—viz., 3.65c. to 3.60c. for No. 27 Black One Pass Cold Rolled Soft Sheets, and 62½ and 65 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: The Sheet trade has been unusually prominent because of the suspension of the union mills. Inquiries have increased, and orders are taken subject to delays from strikes. The stocks in store locally are not large, and while the demands made upon them are in keeping with the conditions prices from store have not advanced. The situation has added interest from the readjustment in the prices made last Monday. While this adjustment of Sheet prices with those of other products has been in the nature of a reduction on mill quotations, that result is said to be only incidental to the main purpose, which is to harmonize the values of the various Steel products. No. 27 Black are strong at 3.40c. to 3.50c. in small lots, and Galvanized at 65 and 10 to 70 off.

Old Metals.—The demand for Old Metals of all kinds is tame and prices are rather weak, while showing no quotable change. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 15 c.
Light and Tinned Copper	per lb. 13½c.
Heavy Brass	per lb. 10 c.
Light Brass	per lb. 8 c.
Lead	per lb. 4 c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 18½c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	$6.00
Wrought Iron Scrap, per gross ton	$10.50 to 11.00
Heavy Cast Scrap, per gross ton	10.00 to 10.50
Stove Plate Scrap, per gross ton	7.00 to 7.50
Burnt Iron, per gross ton	5.00 to 5.50

The idea of having a roof garden in connection with a building is not confined exclusively to theatres and apartment hotels, but is now and then to be found as a feature of a church edifice. There was recently dedicated in Parkersburg, W. Va., a kite-shaped church building with a roof garden consisting of an upper story with 22 windows. These are so arranged that when opened the sides of the structure practically disappear, leaving only the supports of the roof. The pastor of the church planned the building.

THE PIG IRON MARKET.

New York.—The market has been very quiet during the week under review; no sales of any magnitude are reported. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, $16 to $17.50; No. 2 X, $14.75 to $15.75; No. 2 Plain, $14 to $14.50; Tennessee and Alabama brands, No. 1 Foundry, $14.75 to $15; No. 2 Foundry, $14 to $14.50; No. 1 Soft, $14.50 to $15; No. 2 Soft, $14 to $14.50; No. 3 Foundry, $13.25 to $13.50; No. 4 Foundry, $12.75 to $13.25.

Chicago.—The market during the week has been somewhat quiet. There has been so much uncertainty ahead regarding the continuance of steady operations that some melters of iron have not only withdrawn from the market, but have temporarily closed their foundries until the question of wages has been determined. Trading has been of fair volume. Some of the orders were for deliveries during the last quarter of the year. Prices are without material change. The local Irons are strong and some of the Southern producers are said to be firmer in tone, but there still is reported a shading of quotations of other Southern producers. We quote as follows:

Lake Superior Charcoal	$17.00 to $18.00
Local Coke Foundry, No. 1	15.50 to 16.00
Local Coke Foundry, No. 2	15.00 to 15.50
Local Coke Foundry, No. 3	14.50 to 15.00
Local Scotch, No. 1	15.75 to 16.25
Ohio Strong Softeners, No. 1	16.00 to 16.50
Southern Silvery, according to Silicon	14.90 to 15.15
Southern Coke, No. 1	14.65 to 14.90
Southern Coke, No. 2	14.15 to 14.40
Southern Coke, No. 3	13.65 to 13.90
Southern Coke, No. 1 Soft	14.65 to 14.90
Southern Coke, No. 2 Soft	14.15 to 14.40

Pittsburgh.—The Pig Iron market is in the same condition as noted last week. Bessemer Iron for July shipment is pretty well sold up and prices are firmly held. Foundry Iron is unchanged. We quote Bessemer Iron at $15.25 to $16: No. 1 Foundry at $15 to $15.25; No. 2, $14.50 to $14.75; No. 3, $14 to $14.25, all f.o.b. cars Pittsburgh.

Cincinnati.—Quietness is still the order of the day in Pig Iron circles. The trading is confined almost exclusively to retail orders and but few are booked for a larger amount than 100 tons. Outside of these the market is at a standstill and weak at the given quotations. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$13.50 to $13.75
Southern Coke, No. 2	13.00 to 13.25
Southern Coke, No. 3	12.25 to 12.75
Southern Coke, No. 4	11.75 to 12.00
Southern Coke, No. 1 Soft	13.50 to 13.75
Southern Coke, No. 2 Soft	13.00 to 13.25
Southern Coke, Gray Forge	11.75 to 12.00
Southern Coke, Mottled	11.75 to 12.00
Ohio Silvery, No. 1	15.50 to 16.00
Ohio Silvery, No. 2	14.50 to 15.00
Lake Superior Coke, No. 1	14.50 to 15.00
Lake Superior Coke, No. 2	14.00 to 14.50
Lake Superior Coke, No. 3	13.50 to 14.00

St. Louis.—The market continues in the quiet condition which has characterized it for the past 60 days. There are quite a number of inquiries at hand, which, however, do not develop into sales of any moment. The firm stand taken by the large producers not to further shade the prices has resulted in filling the order books of the smaller concerns, and has also strengthened the impression that prices are as low as they are likely to go. As there are only a limited number of consumers who have arranged for their requirements beyond September 1, an early increase in the demand is confidently anticipated. We quote carload lots as follows, f.o.b. St. Louis:

Southern, No. 1 Foundry	$14.25 to $14.50
Southern, No. 2 Foundry	13.75 to 14.00
Southern, No. 3 Foundry	13.25 to 13.50
Southern, No. 4 Foundry	12.75 to 13.00
No. 1 Soft	14.50 to 14.75
No. 2 Soft	14.00 to 14.25

CHICAGO REPORT.

Scrap Iron & Steel.—The week has been rather quiet and the demand is light. Prices are weak. Dealers quote the following prices in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap	$10.50 to $11.00
Machinery Cast	10.00 to ....
Malleable Cast	10.00 to 11.00
Stove Plate (free from burnt)	7.00 to 7.50
Burnt Iron and Grate Bars	5.50 to 6.00
Sheet Iron and Hoops	6.00 to 7.00
Plow Steel	9.00 to 10.00

Breaking Stock	9.00 to	9.50
No. 2, such as Shovels, Hoes, &c.	.... to	7.00
Old Boilers—whole (Iron)	.... to	7.00
Old Boilers (Iron) cut in single Sheets and Rings	9.50 to	10.00
Old Gas Pipe and Boiler Tubes	9.50 to	10.00
Cast Borings	.... to	3.75
Turnings	8.00 to	8.50
Horseshoes	11.00 to	....

Old Metals.—Trade continues dull. Consumers are not buying, and no improvement is looked for before the settlement of the machinists' strike. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	15 c.
Copper Bottoms	13½c.
Copper Clips	14½c.
Red Brass	13⅞c.
Yellow Brass	10 c.
Red Brass Borings	11½c.
Yellow Brass Borings	9 c.
Light Brass	7¾c.
Pipe Lead	4 c.
Tea Lead	3½c.
Zinc	2¾c.
Pewter, No. 1	19 c.
Pewter, No. 2	10 c.

Old Rubber.—Conditions are unchanged. Buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$20.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7 2-3c.
Rubber Car Springs	....	4¾c.
Inside Bicycle Tubing	....	21 c.
Outside Tubing	....	7¼c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—The past week has been fairly active, with a good demand. A discount of 20c. from these figures is allowed on all Coal ordered to be shipped in July. The discount is 10c. in August, full prices being restored in September. Quotations on carloads are as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.25	6.50
Kansas City, Mo.	8.25	8.50

THE HARDWARE TRADE.

The first half of the year has made for itself a memorable record, in view of the large volume of business and the excellent tone which has characterized the market. Manufacturers in most lines have had a very satisfactory trade at remunerative prices. With the merchants, large and small, a similar condition of things has prevailed. The volume of business both with jobbers and retailers has been large and reasonably profitable. It has not been an era when speculation entered much into the conduct of trade, but merchants have felt safe in their purchases, which have been liberal, to meet the requirements of their customers. Competition with both the retail and wholesale houses has been active, and the changing channels and methods of trade have presented many problems of difficulty. On the whole, the past six months have given to the producers and distributers of Hardware and Iron products an exceptionally favorable opportunity for successful business. All except those handicapped by some unusual circumstances or conditions have done, it may be presumed, a profitable and satisfactory business. It is gratifying to be able to begin the last half of the year with a continuance of prosperous conditions. Trade in practically all branches of business gives evidence of prosperity. The consumption of goods, which absorbs the enormous production of the factories, shows the well-being of the people at large. The crop prospects are excellent, with the probability of a heavy foreign demand. The railroads are, naturally, sharing in the general activity and prosperity. From these propitious conditions the Hardware and Iron trades should be able to secure their share of advantage, especially as there is nothing of grave import in the special features of the market to justify anything but a hopeful view of future business.

NOTES ON PRICES.

Plumbers' Supplies.—The depressing effect of the prolonged spell of excessive heat is reflected in the plumbing and steam fitting trade, where business transactions have been of a very languid sort during the past week. The intervention of the national holiday, too, has tended to make business dull. Consequently trade with the jobbing houses in this vicinity was reduced to a minimum. Nor is this condition at all unwelcome to the jobbers, for what with the enervating weather and the difficulty of securing goods from the makers, the jobber's life has not been entirely a happy one in the near past. Nothing of importance has occurred in the trade since our last report. Prices continue strong all along the line, and the scarcity noted in our previous reports in connection with several lines of goods is as pronounced as ever.

Lead Pipe and Sheet Lead.—Under date of July 1, 1901, Tatham & Brothers, New York, issue announcement of the following cash prices for Lead Pipe, Sheet Lead, &c., subject to the regular discount of 20 per cent. to the trade:

	Per pound.
Lead Pipe	6½c.
Sheet Lead	7¼c.
Tin Lined Lead Pipe	12½c.

Tinware, Galvanized Ware, &c.—The manufacturers of Tinware, pieced, stamped and japanned, galvanized and japanned Sheet Iron Goods, are still working in harmony, the prices decided on several weeks ago, covering an average advance of about 10 per cent., being well maintained. The necessary force, supervised by a central authority, are working out a system of prices based on the net figures determined on last month. It is the expectation that a return to the list and discount method will be made, an announcement of which will probably be made within the next week or two, the plan in contemplation being fixed base discounts with extras.

American Screw Company.—With the beginning of the last half of the year the American Screw Company, Providence, R. I., are bringing prominently to the attention of the trade their discounts on the various goods of their manufacture. The quotations on some of the leading lines are as follows:

	Discount.
Flat Head Iron Screws	90 %
Round and Oval Head Iron Screws	87½ %
Drive Screws	90 %
Flat and Round Head Iron or Brass Machine Screws	50 %
Fillister Head Iron or Brass Machine Screws	40 %
Norway Philadelphia Tire Bolts	82½ %
Eagle Philadelphia Tire Bolts	85 %
Bay State Tire Bolts	77½ %
Flat and Round Head Stove Bolts	77½ %
Stove Rods	65 %
Sink Bolts	77½ %
Rivets, Tinners,' Coopers,' &c	70 %
Hand Rail Screws	60 and 10 %

Refrigerators.—The demand for Refrigerators is very active, taxing all the efforts of the factories to meet it. Prices are strong, and in many cases such goods command a sharp premium over market rates when quick delivery is required. The spell of torrid weather throughout the country naturally has given a sharp stimulus to the demand for Refrigerators, as to all hot season goods.

Wire Nails.—The market for Wire Nails in New York is without change. Consumers are not disposed to buy beyond their current needs. Small lots of Wire Nails from store are quoted at $2.60 a keg.

Cut Nails.—Only a moderate demand for Cut Nails is being experienced in the New York market. Small lots from store rule at $2.25 per keg.

Wire.—The consumption of Plain Wire continues enormously heavy and is larger than ever before; consequently the mills are three or four weeks behind on deliveries. The heavy gauges of Wire are almost impossible to get. Prices are firm at 2.60c. for Plain Wire and 3c. for Galvanized.

Window Glass.—The Window Glass market is devoid

UNIVERSITY OF ILLINOIS LIBRARY

of new features. The demand is light, and prices are likely to remain unchanged until more activity is shown on the part of buyers.

White Lead.—The demand for White Lead in Oil is fair, but shows a falling off in comparison with previous weeks. The advance of the season and the extreme hot weather have combined to produce these results. Small lots of White Lead in Oil are unchanged in price, being quoted at 7 to 7¼ cents per pound.

Linseed Oil.—A further advance of 7 cents per gallon in the price of Linseed Oil was announced on July 1. This brings the retail price of City Raw Oil up to 78 to 79 cents per gallon. Boiled Oil is 2 cents per gallon advance on Raw. The demand continues good, notwithstanding the advance, as purchasers generally have not been buying beyond immediate requirements. It is rumored that the supply of City Oil is limited and insufficient to supply the requirements at the present rate of consumption to the next crop season. Under such conditions, further advances in prices would not be surprising.

Spirits Turpentine.—The Turpentine market has been a declining one, owing to lower prices in the South and the extreme heat at this point. The local demand is dull, and moderate quantities of Turpentine are quoted from store at 37½ to 38 cents a gallon.

Old Rubber.—A fairly active demand for Old Rubber is noted, and prices generally are firm. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb	4¾c.
Rubber Shoes, less than carloads, per lb	7¾c.
White Wringer Rolls, per lb	7¾c.
Inside Bicycle Tubing, per lb	21 c.
Outside Tubing, per lb	7 c.

Mond Fuel Gas in Great Britain.

British commercial and scientific circles, says United States Consul James Boyle of Liverpool, England, are much interested in a discovery made by Dr. Ludwig Mond, of the great chemical firm of Bruuner, Mond & Co., Limited, whose headquarters are at Northwich, Cheshire. This discovery is a gas for furnaces and gas engines, which, it is claimed, can be supplied to consumers at a maximum price of 4 cents per 1000 cubic feet. Public attention has been drawn to this discovery by the recent application of a number of leading manufacturers in the South Staffordshire district for a bill in Parliament to give the necessary legal authority to erect plants, construct mains, &c., to supply an area of 135 square miles. The bill has been read twice in the House of Commons and has passed through the committee stage successfully, so that the scheme will, in all probability, be in actual operation within the next few years. Five generating stations are to be established, and from these the gas will be conveyed, under pressure in underground pipes, to the various manufacturers in the district for use in furnaces and gas engines, but not for illumination. Mond gas is a producer gas, made from the cheapest class of small coal and dust, commonly called "bituminous slack." Dr. Mond discovered a process by which this cheap slack can be converted into a clean gaseous fuel in such a way that a very large proportion of the nitrogen of the coal is recovered (as ammonia) and converted into sulphate of ammonia, which is a very valuable manure and fertilizer. The distinguishing features of the Mond process are:

1. The utilization of cheap bituminous slack.

2. The recovery of 90 pounds of sulphate of ammonia (value at present $1.94) for every ton of slack gasified.

3. Low temperature working, so that no clinkers are formed in the producer, and the ammonia is not destroyed.

4. Very perfect regeneration of heat by an ingeniously designed system, using water as a heat carrier.

5. The production of a clean gas of extremely uniform quality, free from tar and grit, and of a higher calorific value than most other producer gases.

Mond gas is not a lighting gas; it burns with a pale blue flame and has a much lower heating value than illuminating gas. It is a gaseous fuel, adapted for wholesale use as a heating and power agent, and the gas engines at Winnington, Cheshire, using Mond gas, hold the world's record for economy and for long and continuous runs. An experimental open hearth steel furnace has been worked with excellent results, using Mond gas, and the gas is in daily use for glass melting, ore roasting, many kinds of furnace work, evaporating liquids, heating buildings, &c.

What will probably be one of the largest buildings of its kind in this country at least is the structure now in course of erection at Schenectady, N. Y., to be used as the offices of the General Electric Company. It will be over 200 feet in length, more than 100 feet wide and five stories in hight, and will be equipped with every modern appliance in regard to heating, lighting, ventilation and sanitation. The cost of the structure will be in the neighborhood of $250,000, and it will have 100,000 square feet of floor space.

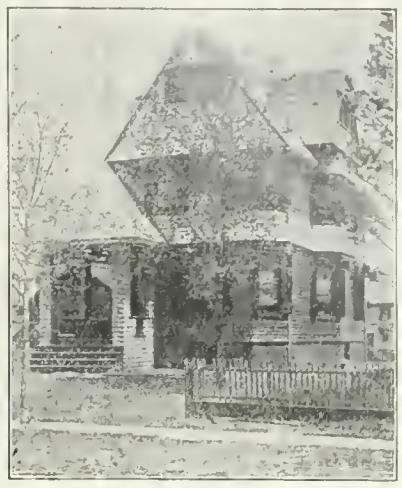
CARPENTRY AND BUILDING

Series No. 2.

Modern American Dwellings

With Constructive Details.



The Most Elaborate and Complete Volume of Plans Ever Brought Out for the Use of Architects, Builders and Home Seekers.

BY NUMEROUS ARCHITECTS.

A selection of thirty-seven designs of artistic suburban dwellings erected in various sections of the country, at a cost ranging from $2,000 to $5,000, and embracing floor plans, elevations and constructive details showing interior and exterior finish, all drawn to a convenient scale, together with brief extracts from the specifications.

Those who contemplate building a home will find this volume of great value. In connection with each design is given the necessary floor plans, elevations and constructive details as will enable any practical builder to execute the work. The plans are diversified in both the interior arrangement and external appearance, and will afford to persons of various requirements an opportunity to select a home suited to their taste and convenience.

33 Half-Tone Engravings. 127 Full Page Plates of Elevations, Floor Plans and Constructive Details. 40 Pages of Descriptive Text. Size 9 x 13 in. (oblong), Handsomely bound in cloth. PRICE $2.00.

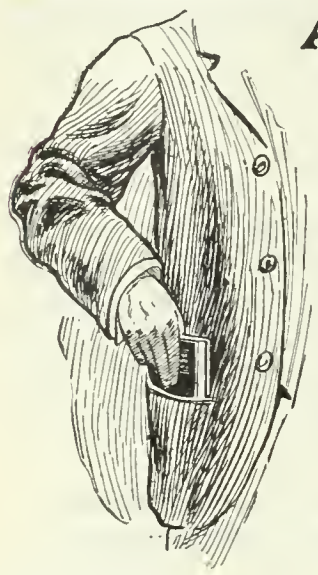
TINSMITHS' HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION



A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop.

An elementary manual for the young tinsmiths: A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 ~ Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

A Few Points About
The Dover Elbow:

No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe.
It is handsome. It is strong. It is the best elbow on the market.

MOST OF US LIKE "FACTS."

It takes ability of a peculiar character and a high regard for truth to always give "facts." "Any fool feels competent to give advice."

Now, these are facts regarding

"Osborn's Star Old Style."

"Star" is a beautifully finished *high grade plate*, and was made especially to fill a demand for a really good plate to sell at a moderate price.

We use the same care and skill in producing this plate as is used in the manufacture of our Celebrated Guaranteed Old Style

The tinner likes "Star." He likes its appearance, it works well. We have never placed a box of "Star Old Style" in any tin shop that has not brought forth more orders for the same goods. Our sales on this brand alone exceed that of any of the brands we handle, exclusive of Guaranteed Old Style.

The price is very low in view of the very fine quality of the plate.

We shall be very glad to submit you samples and prices upon your request.

J. M. & L. A. OSBORN,
CLEVELAND —and— COLUMBUS.

ACCIDENTS SOMETIMES HAPPEN.

There is nothing accidental, however, about the success of Berger's "Classik" Metal Ceilings.

Berger's "Classik" Metal Ceilings

are designed on the correct artistic basis.

They are high art ceilings and appeal to high grade trade.

They are handsome in appearance, harmonious in style and stamped with a clearness which fully brings out the detail.

They combine the mechanical excellence of sheet metal with the artistic effect of plastic relief.

A room finished with Berger's "Classik" Metal Ceilings stays finished.

Both you and your customers would like them.

Write to-day for handsome catalogue and full particulars.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

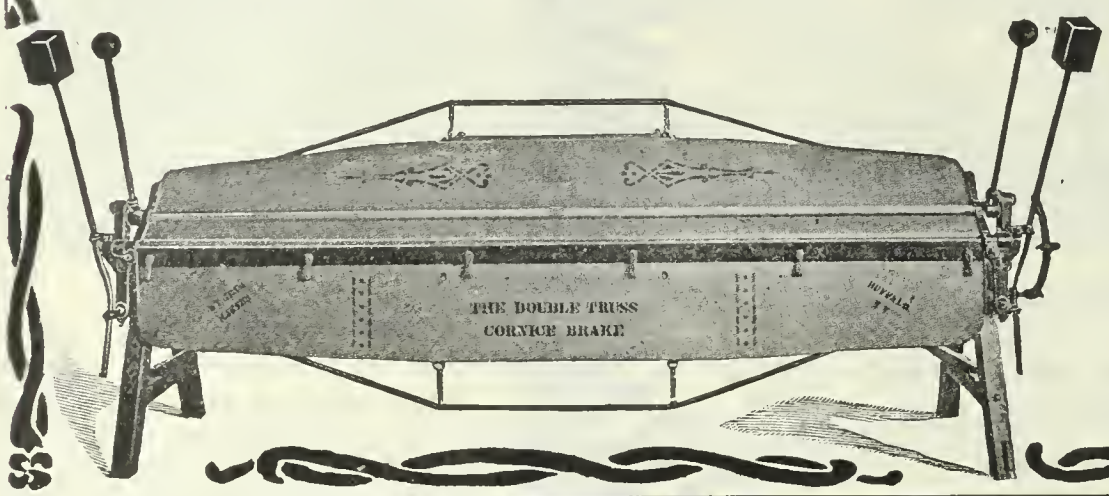
THE DOUBLE TRUSS CORNICE BRAKE.

This is the most practical brake on the market.
It is the most practical because, in the first place, it is lower in price than any other Cornice brake that will do perfect work.
Secondly, because its practical construction enables you to use it to the most profitable advantage.
When you hear about a good thing in your line of business, investigate it. Turn on it the light of reason and consider its money-making possibilities.



Let us send you information regarding our double edge on front leaf, for making fine members and corrugations.

The Double Truss Cornice Brake Co.,
1453 Niagara St.,
BUFFALO, N. Y.

Ask us about our new Electric City Gutter Former. It will do as good and as quick work as any other machine used for a like purpose and can be sold for 50% less.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 22 iron.
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel, with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

PRICE, - - $35.00.

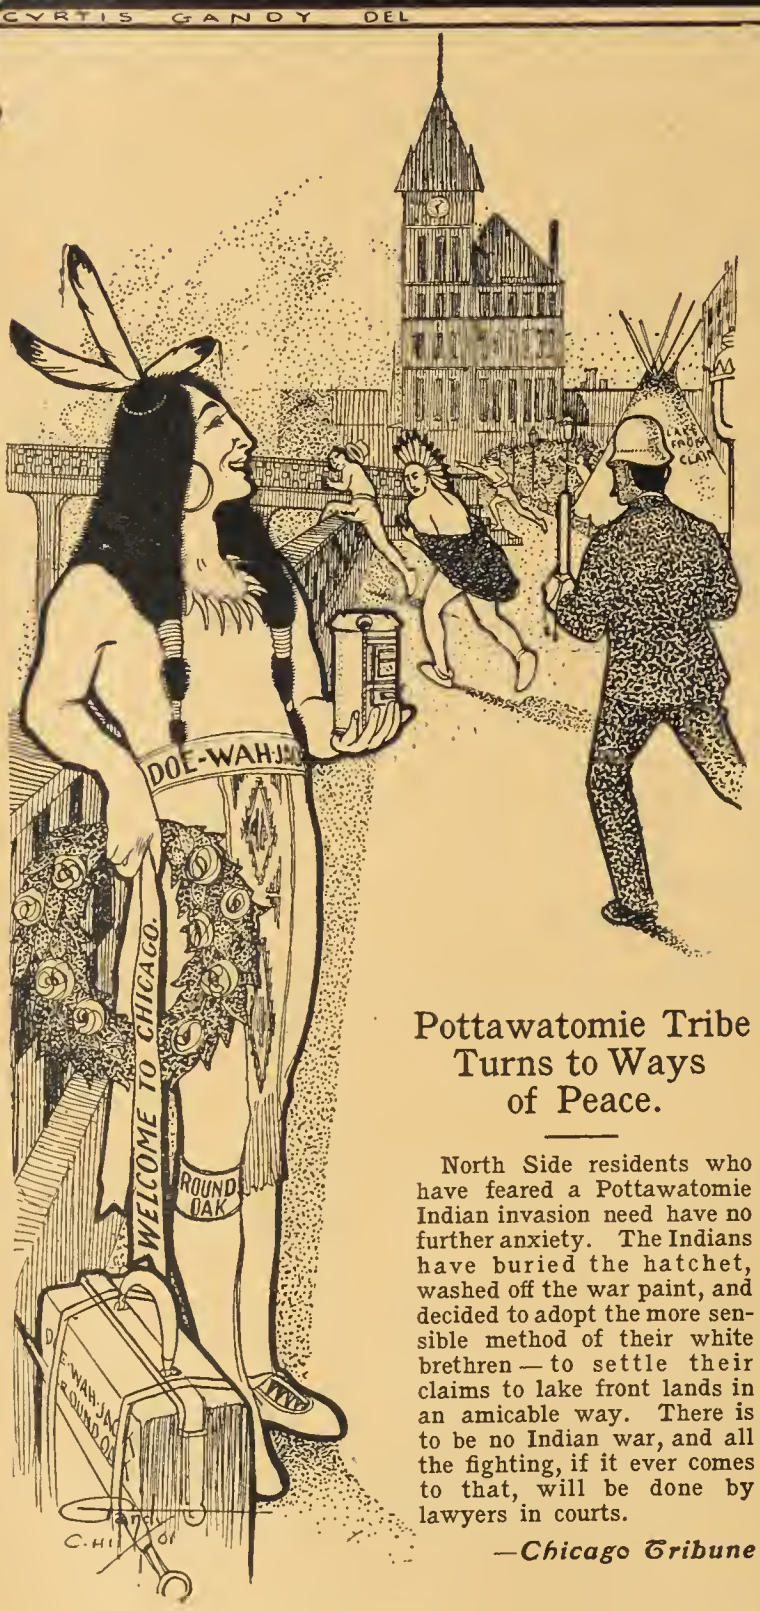
ROUND OAK
STANDARD OF AMERICA



Pottawatomie Tribe Turns to Ways of Peace.

North Side residents who have feared a Pottawatomie Indian invasion need have no further anxiety. The Indians have buried the hatchet, washed off the war paint, and decided to adopt the more sensible method of their white brethren — to settle their claims to lake front lands in an amicable way. There is to be no Indian war, and all the fighting, if it ever comes to that, will be done by lawyers in courts.

—Chicago Tribune

It won't harm you

to know all about the *Round Oak* furnace. Perhaps you cannot sell it at first. Price may be the only thing your customers look at. They may have been educated that way. Still, we have had that state of affairs confront us before, and we have won out. Quality will do it.

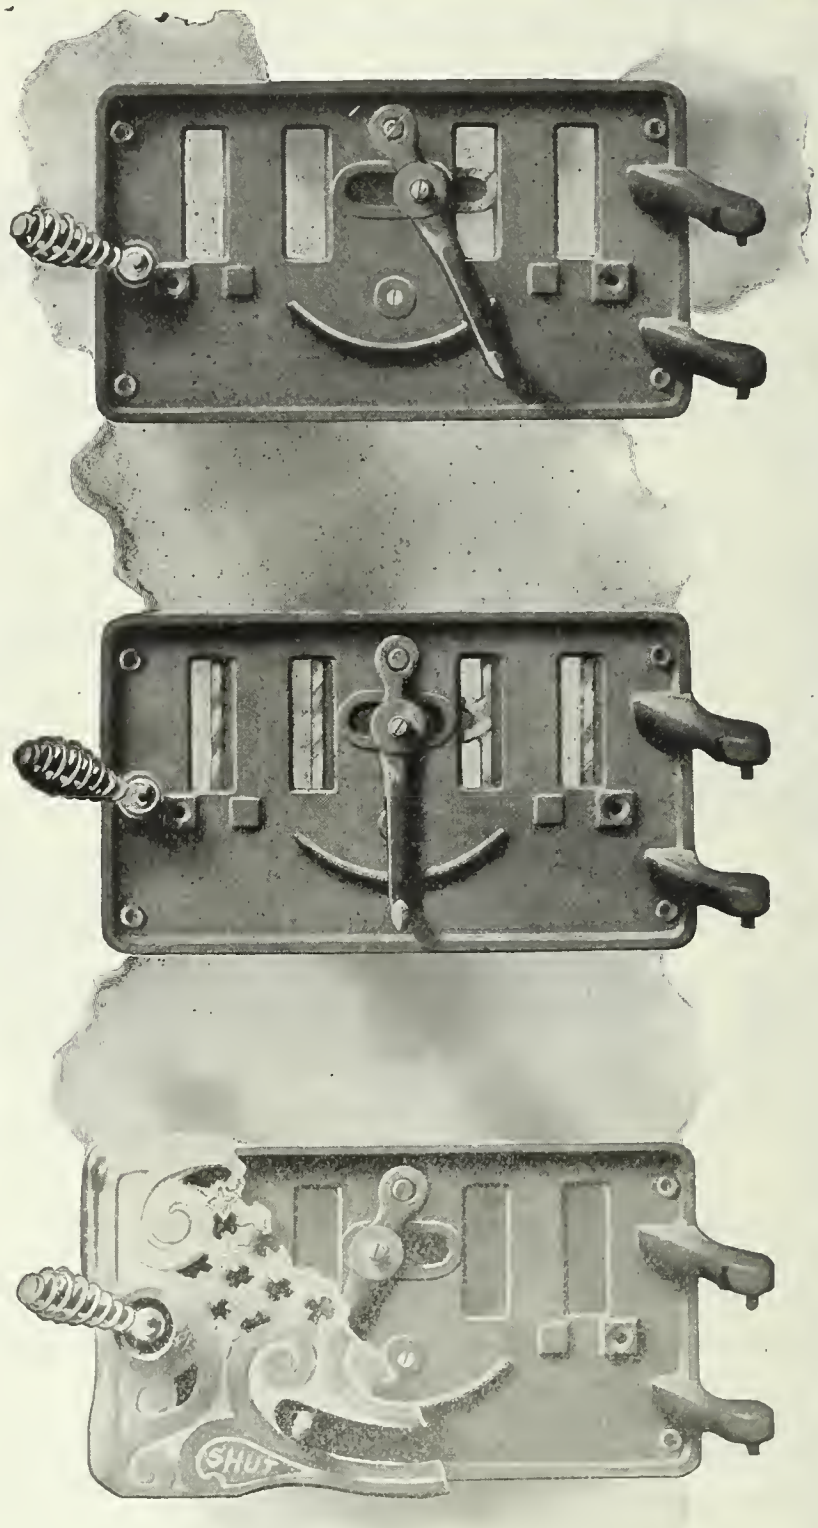
RINGEN STOVE Co. SAINT LOUIS

Moore's Air-Tight Heater

M TRADE MARK

The Air-Tightness of an Air-Tight Stove Consists in Its Being Air-Tight



The above simple fact is frequently lost sight of in the meaningless use of the word air-tight, loosely applied to many stoves regardless of the fit-ness of their joints. Much of the secret of the success of MOORE'S AIR-TIGHT HEATER lies in the perfection of the base door, all the joints being mechanically ground to within $\frac{1}{1000}$ of an inch of actual contact.

Burn Hard or Soft Coal, or Coke. Large Doors.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

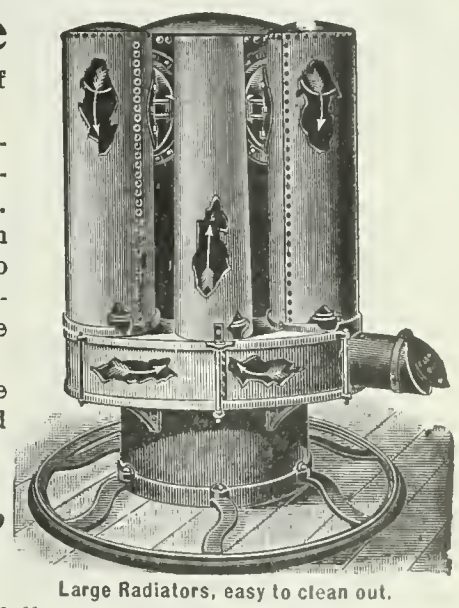
We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The ***American Furnace*** is made for the better class of trade; is durable, clean and economical in fuel.

The American Furnace Co.,

1911-13 PINE STREET, ST. LOUIS, MO.

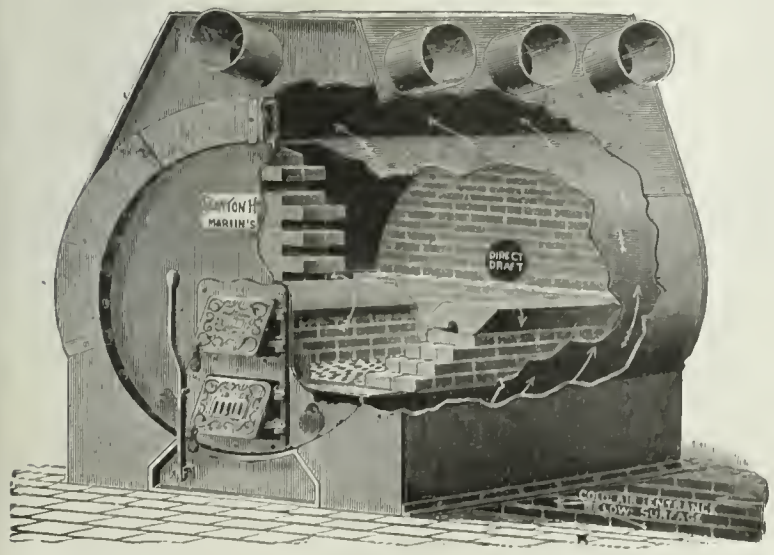


Large Radiators, easy to clean out.

Write for prices and secure the agency before the other fellow gets it.

The Stanton Seamless Heater,

PORTABLE CASED.



LOUISVILLE, KY., Apl. 5th, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly,
ROBINSON-HUGHES & CO

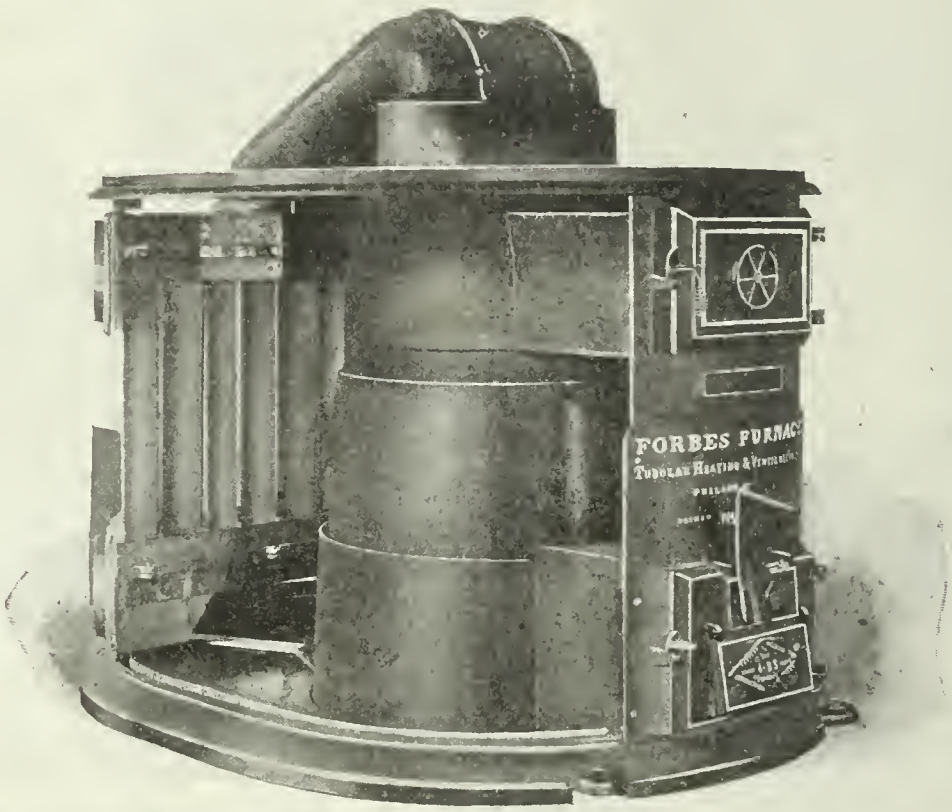
A Radical Departure.

FORBES (Improved) WARM AIR FURNACE.

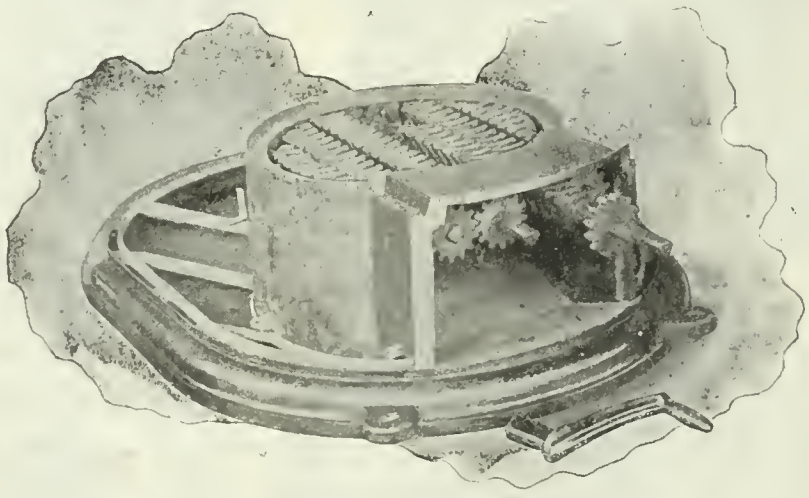


VERY LOW IN HEIGHT, 4 FT. 3 IN. OVER ALL, IN ALL SIZES.

Our aluminum radiating manifold is an entirely new principle applied to heating air. We save the heat that all other heaters allow to waste up the chimney, and send it through the house—saving coal for the consumer.

THE NEW TRIPLEX GRATE.

Perfect Shaking.



Perfect Dumping.

Furnished with the Forbes Furnace.

Can be easily repaired, each bar can be taken out separately and replaced without disturbing the other bars.

A FEW POINTS OF MERIT, DEMONSTRATED BY THE FORBES FURNACE: Being oval in shape, more pipes can be taken from it than from any other furnace.

Great durability and ***economy***—will last for years and is twice as economical as any other furnace.

Equal heat to all points, regenerative—burning ***all gases*** and—

LOW IN PRICE—WITHIN THE REACH OF ALL.

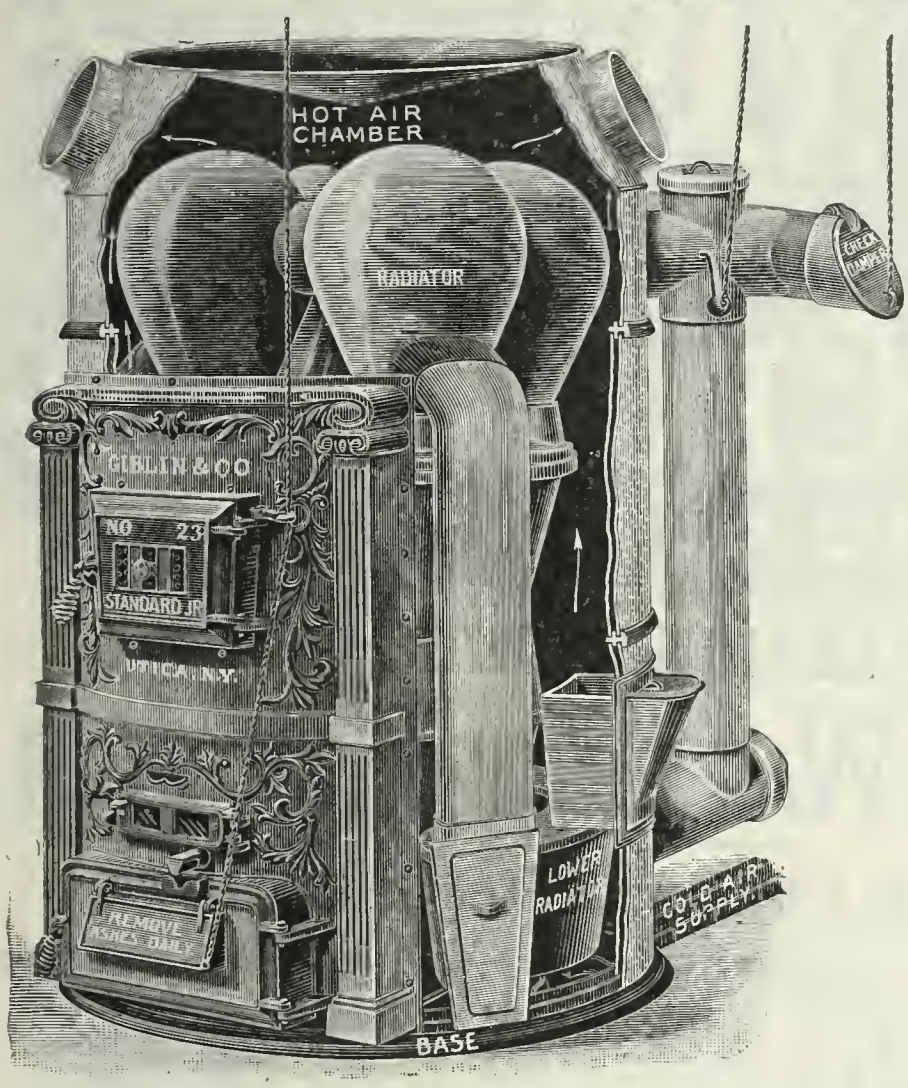
TUBULAR HEATING AND VENTILATING CO.,

232 QUARRY ST., PHILADELPHIA, PA.

TOUCH A MAN'S POCKET



and you touch a sensitive spot. If your customer asks for a furnace and you furnish him with the cheapest furnace obtainable, it surely is not the best and he will judge all other furnaces by what he gets. He will by using the cheapest furnace, burn more coal than he should; will burn it imperfectly.

IT WILL

cause more work, need frequent repairs, make him thoroughly dissatisfied. Such are the results of a direct draft furnace. We present the furnaces illustrated herewith to

SHOW

what indirect draft furnaces can accomplish. Nobody now uses a direct draft heating stove, because of the waste of fuel and the impossibility of regulating it.

These Furnaces

are in furnaces what base burners are in stoves and

Secure

for the user the benefit

of **Heat** without

wasting fuel. They are operated with a steady, low fire, providing an even, continuous temperature

In Every Room.

Whichever dealer secures the agency of these furnaces is sure to get the bulk of the business; and because he is selling something different from all other dealers will make sales at a good profit and make every one sold an advertisement for his business.

Dealers who have sold other furnaces and have found no profit in the business should investigate the merits of these furnaces and secure the agency and exclusive territory.

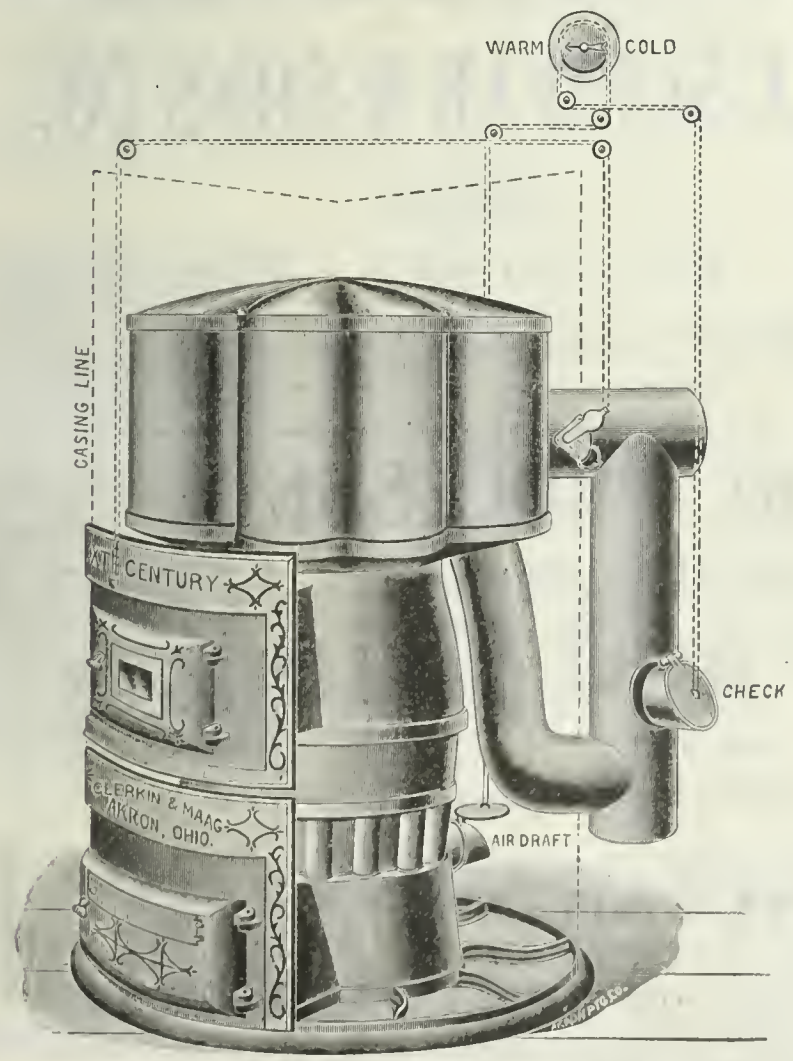
NEW XXth CENTURY LINE OF HEATERS



Especially adapted to hard coal and wood. We will try to persuade you to order one sample only. We feel insured of the balance of your trade without solicitation. Our new catalogue tells all about the points of merit.

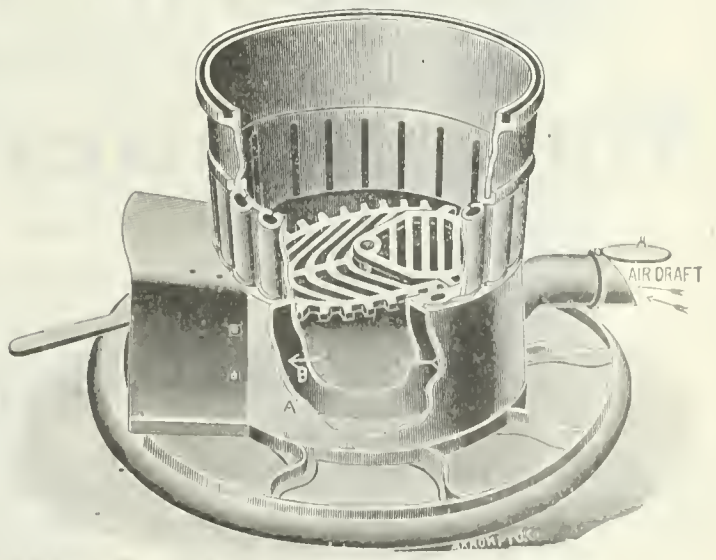
THE WORLD'S BEST HEATER.

Our soft coal line of heaters needs no introduction. It is already a world beater. Address

THE XXth CENTURY HEATING & VENTILATING CO.,

AKRON, O., U. S. A.

THE EXCLUSIVE FURNACE HOUSE OF AKRON.



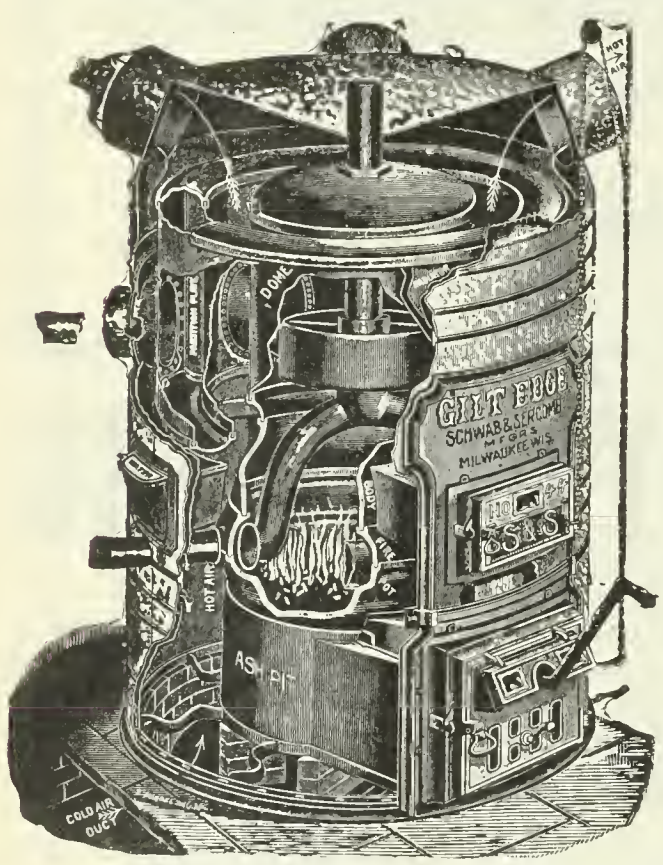
"We are not in a position to place order for car of Furnaces now.

"We do think, in the course of time, we may do so, as we are satisfied with the trial of those we have sold.

"The 'DIGHTON' has advantages over much more expensive Furnaces, especially in the ECONOMY OF FUEL."

The above is a fair sample of many letters of the same general character which we have in file, this particular copy having been made from a letter which we received May 1st from one of the best and, we think, one of the largest furnace dealers in the United States.

DIGHTON FURNACE CO., Taunton, Mass.



UTILIZED radiating surface, that is economy. Sectional fire pots from 1 in. to 2 in. thick and other parts in proportion, that is durability. Positive gas-tight joints, that is necessary to health. These, with all other improvements for ease of management, are combined in the Gilt Edge Furnaces. They are made for all kinds of fuel, and are the very best.

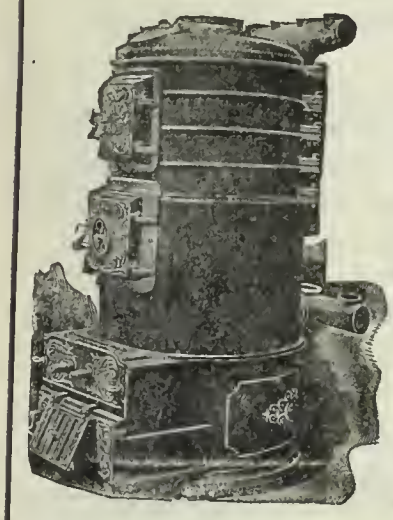
KEWANEE BOILER COMPANY

Home Office and Factory,

KEWANEE, ILLINOIS.

Chicago Store, 169 Lake St.

HONEST SERVICE ALWAYS.



George Washington's stamp on a barrel of apples always enhanced the value of the apples. For the buyer realized that if he branded it, the goods must be first quality and full measure.

"GURNEY" HEATERS,

BRIGHT IDEA, 400 SERIES and DORIC,

enjoy similar confidence. For the name of Gurney is a stamp of integrity. Durability and honest service have always been our aim. We admit our claims have been positive; but "Gurney" Heaters have fulfilled them all; so that *each heater placed is the strongest kind of recommendation for other business.*

There's just as pleasing a difference between selling "Gurney's" and selling other heaters as there is between doing any two other things, one of which is easy and the other hard. Wou'dn't you prefer the easy way? Then become a "Gurney" Agent. We shall be glad to hear from you at any time. Latest trade catalogue on request.

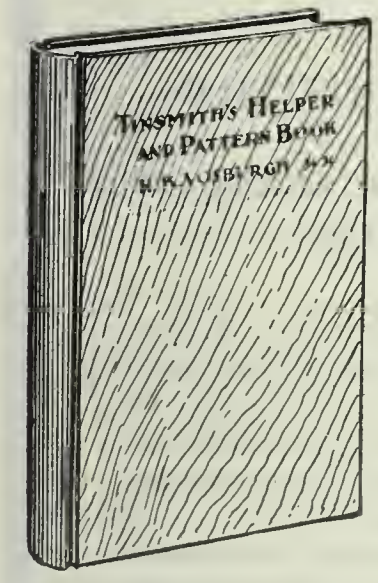
TINSMITHS' HELPER AND PATTERN BOOK.

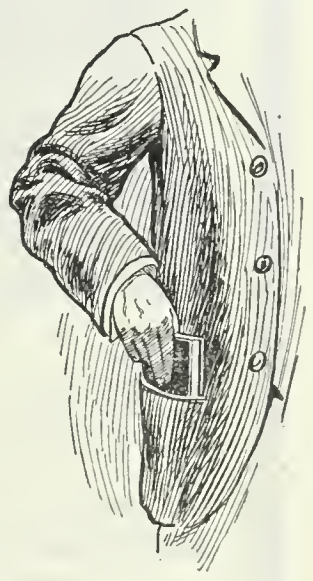
With Useful Rules, Diagrams and Tables. By H. K. VosBurgh.
Revised Edition, 120 Pages, 53 Figures, Size 4½ x 6¾ Inches,
Cloth Bound. Price, $1.00.



We present a new and improved edition of this useful book, believing it to be one of the most important assistants to tinners and other mechanics that is published. The diagrams and patterns are now illustrated by means of new engravings, greatly improving the appearance of the book. The tables, rules and recipes have been carefully revised, these, with important additional tables, being printed from new type.

This edition is printed on fine paper, and bound durably in cloth, in a convenient pocket size.

The Tinsmiths' Helper is not intended to be a comprehensive treatise on sheet metal pattern cutting, which field is covered only by "The New Metal Worker Pattern Book," but it contains a collection of patterns of the most common occurrence, described in the plainest way. It meets the requirement of a simple hand-book for young tinners, and will be an invaluable aid to all sheet metal workers for the compilation of tables and rules alone. A list of the contents is given below.



DIAGRAMS AND PATTERNS.

To Find the Center of an Arc.
To Describe an Octagon Within a Given Square.
To Describe an Octagon Within a Given Circle.
To Describe Breasts for Cans.
Can Breasts.
Pattern for Cone.
To Describe Pattern for Flaring Vessels.
To Cut Hood for Stove Pipes.
To Describe Patterns for Flaring Tinware.
The Old German Rule for Patterns for the Cone.
Frustum of a Cone.
Flaring Vessel in Three Pieces.
Rectangular Funnel.
For Strainer Pail or Watering Pot Breast.
Scale Tray or Scoop.
To Find Length of Sheet Required for Oval Boiler. Common Method.
Oval Boiler Cover.
Measure Lip.
Steamer or Pitched Cover.
Heart with Square and Compass.
To Describe a Star.
Pattern for Cutting Balls. To Describe the Gores.
To Describe an Oval.
To Describe Oval with Diameters as 5 to 8.
To Describe an Oval Two Other Methods.
To Describe Oval by Means of String, Pins and Pencil.
To Describe Pattern for Flaring Oval Vessels. Two Pieces.
To Describe Pattern for Flaring Article with Straight Sides and Round Ends. Two Pieces.
To Describe Pattern for Oval Flaring Vessel. Four Pieces.
To Describe Pattern for Flaring Hexagon Article.
To Describe Pattern for Flaring Square Vessel.
To Describe Pattern for Flaring Article with Square Top and Base a Rectangle. Two Pieces.
To Describe Tapering Octagon.
Flaring Article, Top and Base a Rectangle. Two Pieces.
Round Base and Square Top Article. Two Pieces.
Rectangular Base and Round Top Article.
Square Base and Round Top Article. Two Pieces.
To Describe a Square or Right Angle Elbow, Two Pieces.
To Describe Elbow. Quick Method.
To Describe Three-Piece Elbow.
To Describe a Right Angle Elbow. Four Pieces.
Elbow in Five Sections.
To Describe Pattern for Obtuse Elbow.
To Describe a Tapering Elbow.
To Obtain Length of Piece for Tea Kettle Body.
Mode of Stringing Patterns.
String Pattern.
Description of Boiler Block.

EPITOME OF MENSURATION.

Mensuration of the Circle and Its Sections.
Mensuration of Solids and Capacities of Bodies.
Mensuration of Surfaces.
Mensuration of Cones and Pyramids.
Mensuration of Cylinders.
Mensuration of Spheres.

The Kelsey Warm Air Generator

SEE OUR EXHIBIT
AT THE
PAN-AMERICAN EXPOSITION.

World's Columbian Exposition, Chicago, 1893, Award, With Medals.

For a new and original, and very efficient form of Warm Air Heater, in which heavy cast iron sections, with corrugated sides, through which is circulated the fresh air, form the fire box and combustion chamber, and are exposed on all sides and throughout their length to the fire and hot gases, thus exposing an exceptionally large surface to the fire.

For the means whereby the warm air may be directed in separate and independent channels, and distributed in such proportions as to insure uniformity of heating in different parts of a building.

A Half Year's Failures.

The healthful condition of things existing in the business world during the first half of the present year is illustrated in the figures of six months' business failures in the United States, given by *Dun's Review*. These statistics show that commercial failures for the six months ended June 30, 1901, were 5804 in number, with aggregate liabilities of $71,645,244, as against 5362 in the same period of last year, when the liabilities amounted to $100,570,134. The increase in the number of failures is attributed to the fact that a large number of small traders went under in June, following the panic in the stock market in New York. It will be observed, however, that the aggregate liabilities this year were nearly $30,000,000 lower than those of the first six months of 1900. Of the failing concerns, 1265 were manufacturers whose aggregate liabilities were $21,691,000, while 4189 were traders owing $24,364,000, a decline of about $3,000,000 in manufacturing and $5,000,000 in trading as compared with a year ago. One especially interesting and favorable feature connected with the commercial mortality of the past half year is the fact that the average liabilities per failure were smaller than in the corresponding period of any other year in the past twenty-five years, with the exception of 1899. Considering the record of failures geographically, it is found that there was an increase in the number of defaults in New England, almost wholly in Massachusetts and Connecticut. In New York City there were many more small failures than a year ago, largely on account of the reason above given, but in almost every other part of the country a marked decrease in the amount of defaulted liabilities is shown. Thus in New York State, New Jersey and Pennsylvania the aggregate of liabilities was about $17,800,000 in the first half of this year, as against $32,917,000 last year. Failure records are scarcely less valuable as a gauge of prosperity than bank exchanges and railway earnings, and as these three business weather vanes all point in a favorable direction, there is every reason to look for a continuance in the future of the prosperity which so clearly marked the first half of the year.

The Fire Waste.

The record of fire losses for the month of June, as compiled by the New York *Journal of Commerce*, shows a gratifying decline from the remarkably heavy losses recorded for the first five months of this year and for the whole of the year 1900. The loss for June amounted to $9,599,000, as compared with $22,380,000 in the preceding month, and $21,281,000 in June, 1900. The aggregate of fire losses for the first half of 1901 is given as $88,935,000, as against $103,299,000 during the same period of 1900. The June fire loss of last year was swollen by the great Hoboken disaster, but even taking that into consideration the very marked decline shown last month indicates a welcome change from the expensive experiences which the fire insurance companies have had for almost two years past. Yet it appears to be a larger sum than should be wasted in one month, when we consider the improved fire fighting facilities possessed by our cities and towns, and the fact that legislation aimed at the prevention of fire has been so widely adopted. Taking the city of New York as an example, the losses by fire in the boroughs of Manhattan and the Bronx alone amounted last year to $7,500,000, and during the past three years to $17,835,000, as compared with $10,197,000 during the preceding three years. This big increase has naturally given the underwriters much concern, and they have been making an investigation of the causes. The result of the investigation is a severe arraignment of the city Building and Fire Departments, which are held to be responsible for the non-enforcement of the laws intended to protect buildings against fire.

Good Counsel on Strikes.

President Samuel Gompers of the American Federation of Labor has issued a circular to all of the affiliated labor unions which contains some very sensible advice against hasty action in declaring strikes. This proceeding, Mr. Gompers says, was rendered necessary by the action of a number of unions entering into strikes too hastily, which strikes have proved very costly and at the best only partially successful. The circular says in part:

No strike shall be ordered until every effort has been made by a committee to settle the differences with the employer.

A strike should be inaugurated only as a last resort.

A conciliatory policy is more advantageous than contest. Arbitration should be offered before a strike has begun. It is easier to adjust a difference before a strike than after.

Whenever the question of strike is to be voted upon a secret ballot should be had and each member required to write his own ballot.

When the union enters into an agreement with an employer its terms should be faithfully kept, regardless of temptations to break it.

This is sane and wholesome advice and timely withal. If the principles set forth by the president of the American Federation of Labor were generally adopted and honestly acted upon by all the labor organizations of the country, the strike as a weapon of offense would rarely be resorted to, and much unnecessary loss and suffering would be avoided. The strike should be used, as Mr. Gompers says, only as a last resort after all efforts in the line of conciliation and arbitration have been exhausted. Unfortunately it has been inaugurated too often in the past on the first impulse. It is a gratifying thing, however, to find one of the most prominent and influential labor leaders of the country coming out squarely in favor of justice and common-sonsible action in a matter so vital to the industrial welfare of the United States. If employers and employed would at all times act on the principles laid down in his circular, instead of acting as

if their interests were fundamentally antagonistic, how much trouble would be obviated and how smoothly the wheels of industry would run.

Problem 218.

As an example of how much may be involved in complying with what is seemingly a simple request, we call the attention of those interested in intricate pattern cutting to an article on another page by the author of "The New Metal Worker Pattern Book," entitled "Problem 218." While the problems in the work referred to are necessarily made as concise as possible, many of them are capable of interesting amplification. There is probably no more complicated form to the pattern cutter, or, in fact, to any one interested in architectural construction, than that of an arch in a curved wall, the subject treated in the above mentioned problem. The simplest means of arriving at a result which is only hinted at in the problem, but which is asked for by a correspondent, involves conditions and operations not usual in ordinary patteru cutting. The article treats of the method of developing the blank from which a mold is to be raised for au arch in a curved wall, the profile of the arch being drawn in compliance with certain requirements. The demonstration is carried only to the point of obtaining the plan and elevation of the splayed or beveled surface of the blank, leaving subsequent work of triangulation to be dedueed by inferenee from methods given in previous problems.

The monthly blast furnaee statistics published by *The Iron Age* show that there has been a slight decline in the weekly capaeity of the pig iron furnaces from 306,991 tons on June 1 to 303,793 tons on July 1, while the stocks of pig iron in the hands of the furnaees deelined from 333,813 tons on June 1 to 327,761 tons ou July 1. In other words, reduction and consumption at present are nearly evenly balanced. So far as the existing plants are concerned, our capacity for the production of pig iron is now pretty close to the maximum. While a number of new furnaces will blow in during the next few months, the old plants are pretty well strained to the utmost, and there is likely to be a good deal of blowing out for repairs. From all quarters there is evidenee that the consumption of Iron is phenomenal, but while the situation statistically is exceedingly sound, there is in the trade an uncertainty and an ill defined feeling that we are on top of the tide, and that slowly receding values may be seen.

The official circulation statement published on July 1 shows an increase for 12 months in the amount of money in the country, including Treasury bullion, of no less than $143,866,932. Of this increase, $21,751,650 is the growth iu the Treasury funds, the balance being in enlarged circulation. The increase is thus distributed: Gold coin, $15,488,000; gold certificates, $45,160,000; silver certificates, $21,141,000; United States notes, $15,853,000; national bank notes, $45,044,000. The amount of silver dollars remains substantially unchanged, while the subsidiary silver increased nearly $3,500,000.

The *Tradesman* of Chattanooga, Tenn., presents an interesting table illustrating the industrial growth of the South for the second quarter of the year 1901. The table shows a number of new industries of all kinds established in eaeh of the 13 Southern States. The total of new industries for the first quarter of the year was 923, an increase of 205 over the first quarter of 1900. For the second quarter of 1901 a grand total of 1002 new industries is shown, being 79 more than in the first quarter of the year. The particular industries in which increases are most noticeable in the first half of this year are cotton and woolen mills, iron working plants, natural gas and oil companies, oil mills and refineries, and compresses and gins.

A comparison of the growth of our export trade with that of other nations of the world shows that the United States, iu the fiscal year just closed, has made by far the greatest increase. According to the figures of the Treasury Bureau of Statistics, the increase in exports from the United States during the past 12 months averaged about $9,000,000 per month; that of the United Kingdom and Russia $3,000,000 per month; that of Franee and Canada $2,000,000, and that of Austria-Hungary and Mexico $1,000,000, while Germany and Spain showed an average loss of $2,000,000 per month, and Belgium a loss of $1,000,000.

At a meeting of the Central Federated Labor Union in New York City on Sunday last, an attempt was made by the president of the Amalgamated Sheet Metal Workers' Association to persuade the union to adopt a resolution directed against the National Guard of the State. The resolution provided that no member of the regular army or navy, or of the State militia or naval reserves, would be eligible to membership in the union, and that any member of the union who became a member of the military or naval arm of the service should forthwith resign from the union. Provision, however, was made that this rule be suspended in time of war with a foreign foe. Fortuuately for its own reputation, the Ceutral Federated Union declined to adopt the resolution.

The State Department at Washington has received from the International Association for the Advancement of Commercial Instruction, the headquarters of which is in Brunswick, a programme for a meeting in the interests of this movement, which was to be held at Zurieh, Switzerland, July 11 to 13. The utility of an international association of this nature was to be discussed at this inaugural meeting, and all persous interested in matters of trade and commereial education are invited to become members. According to the prospectus of the association, the universal nature of trade makes it possible for the question of commercial education to be internationally treated in an advantageous manner, as the bases of trade, and trade requisites are essentially the same in all countries. It is proposed to publish an international statistical review in several languages, also to establish a central office where will be collected edueational plans of various countries, and where information will be given regarding the same to those interested in this subject.

Coal Production of 1900.

Official reports show that the year 1900 closed the century with the largest coal production ever recorded in the United States, and continued the supremacy of this eountry among the coal producing nations of the world. Practically complete returns to Edward W. Parker, statistician of the United States Geological Survey, show the total output of coal in 1900 to have been 267,542,444 short tons, an increase over the preceding year of 13,802,452 tons, or a little more than 5 per cent. The value of this product was $297,920,000, an increase of 16 per cent. over 1899. Coal producers felt a much greater benefit from the improved trade conditions in 1900 than in either 1898 or 1899. Coal contracts are usually made a long time ahead, sometimes more than a year, and much coal was delivered in 1899 at less than it cost to produce it, the price of labor having advanced before the operators could advance the price of coal. The value of the coal product in 1900 (the value being free on board cars at the mines) was equal to nearly one-third of the value of the total mineral product of the United States in 1899.

It is said that a sort of mineral ocher has been discovered in New Caledonia, which, when applied to the surface of iron, in the form of paint, will preserve iron work and prevent it from rusting. It contains about 65 per cent. of peroxide of iron, 6 of alumina, 6 of sesquioxide of chrome, besides proportions of cobalt, nickel, silica, chalk and magnesia.

LOVING CUP FOR EX-PRESIDENT BOAL.

At the quarterly meeting of the Western Association of Stove Manufacturers, held at the Auditorium in Chicago, on Tuesday, July 9, a very pleasing incident was the presentation of a loving cut to ex-President Stanhope Boal of the National Association of Stove Manufacturers. For some time past the members of the national body have been desirous of expressing in tangible form their high esteem for Mr. Boal, as well as their appreciation of his distinguished services during the period in which he presided over the deliberations of the National Association. A loving cup was decided to be most appropriate for the purpose and the matter was placed in the hands of Jeremiah Dwyer of Detroit, to whom subscriptions for the testimonial were forwarded from prac-

Loving Cup for Ex-President Boal.

tically every member of the National Association of Stove Manufacturers.

The cup, of which an illustration is presented herewith, was made by hand to order by Spaulding & Co., silversmiths, of Chicago, and is described by them as follows: The material is of silver 950-1000 fine. The design is in Greek lines and the workmanship is in *Marteté* or hand wrought. The decoration of the handles and the upper part of the cup consists of geranium leaves and flowers and the shield in which the inscriptions are etched is surrounded with beautifully wrought clover and clover leaves.

The inscription upon the face of the cup reads as follows: "Stanhope Boal, Fourteenth President National Association of Stove Manufacturers." Upon the second panel are the following words underneath the monogram of the National Association: "From the members, in grateful appreciation of his distinguished services from May, 1899, to May, 1901." On the third panel is the great seal of the State of Kentucky, in which Mr. Boal was born, and the very appropriate motto, "United We Stand, Divided We Fall."

In the absence of President Parlin of the National Association of Stove Manufacturers it devolved upon Frederic W. Gardner, as first vice-president of the association, to present the testimonial, which he did in the following words:

"On behalf of the National Association of Stove Manufacturers I have a word to say. It is a word of cheer and good will from its entire membership to a gentleman who has served them faithfully and well as their president for the past two years.

"The duties of this office are full of cares and responsibilities and are undertaken at all times with the sincere desire to show by every act and in every way a full appreciation of the high honor conferred upon the recipient.

"It must be a great satisfaction, at the end of the longest term of service granted its presidents, to know, when one has served to the best of his ability, that a feeling of gratitude exists. Such a feeling, as well as one of enduring affection, is expressed in the beautiful testimonial which I now ask former President Stanhope Boal to accept from the membership of the National Association of Stove Manufacturers."

While Mr. Boal was evidently taken by surprise at the beautiful gift of the members of the association, he responded to the speech of presentation in a happy vein and in appropriate terms:

Thinking that some of those who contributed to the testimonial might desire a picture of it, Mr. Dwyer forwarded to each subscriber a handsomely printed artists' proof of the cup, suitable for framing and hanging in their offices. The printing is on heavy calendered paper about 15 x 10 inches in size, and bears as a caption, "Testimonial to President Stanhope Boal from the Members of the National Association of Stove Manufacturers."

MEETING OF WESTERN STOVE MANUFACTURERS.

A regular quarterly meeting of the Western Association of Stove Manufacturers was held at the Auditorium Hotel, Chicago, on the 9th inst. A large representation of stove manufacturers was present from the district west of Pennsylvania and extending to the south of the Ohio River. The chair was occupied by President Joseph W. Emery of Quincy, Ill., and Thomas J. Hogan of Chicago was secretary. The feature of the meeting was the presentation of a beautiful silver loving cup to ex-President Stanhope Boal of the National Association of Stove Manufacturers, particulars of which are presented elsewhere in this issue.

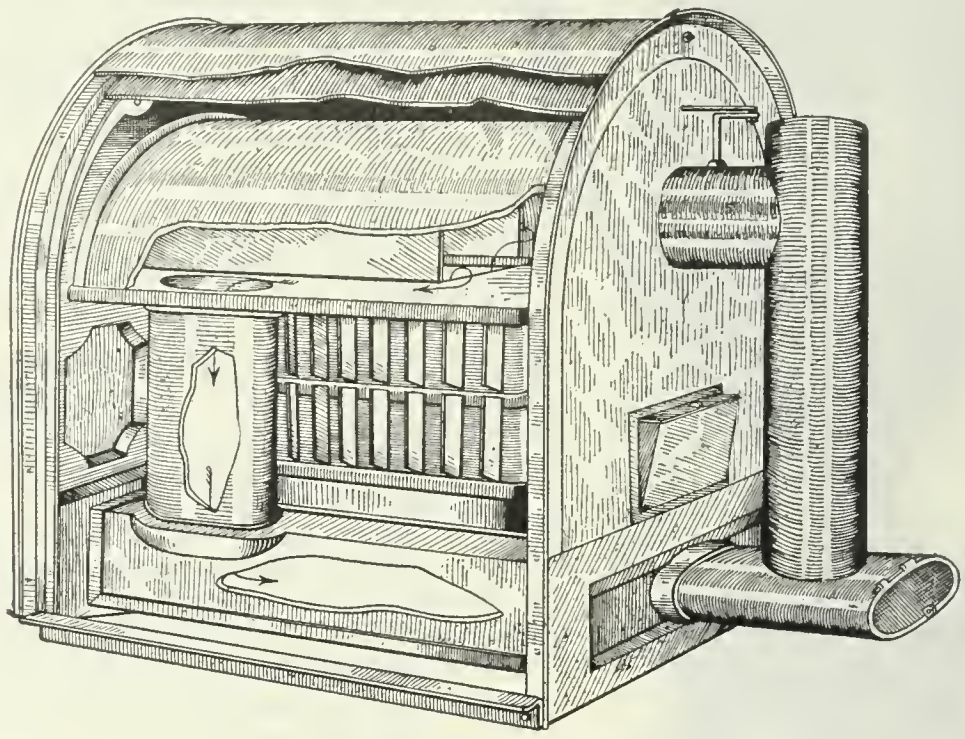
The manufacturers who were present discussed various trade questions. They took no action in regard to prices, and nothing now indicates any change in the direction of lower prices. All of them reported trade quite good. June business was much better than that of a year ago, when, it will be remembered, all branches of trade were seriously affected by the heavy reduction in wire products. Some of the manufacturers report their business double that of the corresponding time last year. Everything looks bright for the usual season's business, the outlook being very encouraging in most agricultural districts.

THE ECLIPSE STOVE MFG. COMPANY of Mansfield, Ohio, are sending to their friends in the trade cards calling attention to the fact that "the greatest eclipse of 1901 is the Lustrous Eclipso," a new hard coal Base Burner, which the manufacturers have just placed upon the market. It is a handsome construction, in the ornamentation of which nickel has been liberally employed. The manufacturers refer to it as "the latest, most unique, the most attractive, the best operating, and the most economical hard coal Base Burner and Double Heater on the market." The announcement is also made that at the Furniture Dealers' Convention, which will be held at Grand Rapids, Mich., the present month, all kinds of Eclipso Stoves and Ranges will be on exhibition. The company's representatives will be in attendance and will take pleasure in showing the goods to all who may be sufficiently interested to call at the store of the Wheeler Furniture Company, who are agents for the manufacturers.

MIDSUMMER MEETING OF THE NEW YORK STOVE ASSOCIATION.

It may seem gratuitous to suggest to the stove manufacturers who compose the New York City Stove, Range and Furnace Manufacturers' Association the advisability of making their next meeting a sort of holiday midsummer meeting at some one of the nearby seaside points. Without desiring to disclose any secrets, it must be pretty well known that while Vice-President Butcher has held the association in line during the absence of the president, the later meetings have been honored by the absence of many of the members, and in consequence the objects of the association have not received proper attention, nor have its edicts been as closely observed as would be beneficial to the whole trade, both wholesale and retail.

President Richardson is now at home and can add to his popularity by having the next meeting at one of the many popular points near New York, where a sea breeze will soothe, while some energy is expended by the members in discussing matters of general interest and importance. If the members were invited to pack a few things in a little grip and spend one night at some seaside hotel, it is probable that this feature of a meeting of the stove manufacturers would induce many to attend and develop a new interest in a work that should not be allowed to cease. A short business session, a good dinner, and a sociable evening spent in the exchange of views on various questions could not but prove attractive to the members.



The Brien Heater.

The Brien Heater.

The efficiency of a hot air furnace depends upon the arrangement of the heating surface so as to utilize the greatest percentage of the heat generated by the fuel, and to present as much surface as possible to the air passing through the furnace. These features are prominent in the Brien heater, made by the Brien heater Company, Hoosick Falls, N. Y., and shown herewith by means of a broken view. The heater is constructed entirely of cast iron in order to more readily withstand the ravages of time and the action of the products of combustion. It consists of a rectangular fire pot provided with a grate of the labor saving type, constructed to allow a free entrance of air to the fire chamber to support combustion. The fire pot has practically perpendicular sides, so that its surfaces are readily freed from ashes, and it is made with outside ribs extended in order to increase the heating surface presented. Above the fire pot is a substantial cast iron dome, affording an ample combustion chamber, and provided with two side flues. After the products of combustion rise from the fire they pass to the front of the heater through the two side flues and there drop down through connecting flues to the bottom flues, which run parallel with the sides of the ash pit and connect at the back, where there is an outlet into the smoke pipe. When starting a fire, a more direct draft can be secured by opening a damper. Another feature of the heater is that the fire pot and dome can be removed from the heater chamber by removing the cast iron front. This is pointed out to be a great convenience, whenever repairs become necessary, as there is no occasion to take down the hot air pipe and casings to get at the inner parts of the heater.

The heater is made in two sizes, having fire pots 15½ x 23½ and 18½ x 29½ inches. The heaters cased ready for the hot air pipes stand respectively 39 and 41 inches high. The smaller heater is rated to have capacity for heating from 7000 to 14,000 cubic feet of space, and the larger from 15,000 to 25,000. The heater has been sold throughout the colder sections of the United States, and the company report that the service has been of such a character as to substantially increase their trade. The company issue a 30-page catalogue devoted to the interests of these heaters, showing half tone engravings of many fine buildings in which they have been installed, and also a number of testimonial letters from satisfied customers.

Twentieth Century Range.

The Art Stove Company of Detroit, Mich., and with Chicago office at 79 to 83 South Jefferson street, are sending out a very neatly printed pamphlet of a size convenient to carry in the pocket, descriptive of what they are pleased to designate as "a truly Twentieth Century line of steel ranges." Attention is called to the fact that the line possesses not one but many improvements calculated to overcome the faults which have been found in steel ranges of the nineteenth century—principally the flue construction. Instead of being made with a sheet flue, the Twentieth Century ranges have two flues, the advantages of which are illustrated by means of colored engravings. The point is made that by means of the two flue construction the heat is evenly distributed, and as a consequence the oven bottom will not be so apt to warp or buckle. The new line of ranges are made of planished steel, which, in combination with richly carved and heavily nickel plated castings, renders them very attractive. All parts are made extra heavy and so constructed as to be unusually durable.

Some of the features are: Interchangeable reservoir,

large broiler door, draft slide, which when opened automatically opens the poker door; removable duplex grate and fire box, with hot blast fire back. The construction of the fire box is such that when burning soft coal there is comparatively little smoke and soot, while at the same time a considerable saving of fuel is claimed to be effected. The entire oven back consists of two thicknesses of steel with a thick layer of asbestos, thus retaining the heat in the oven instead of allowing it to radiate through the back, as is often the case in a sheet flue construction having a single thickness of steel and without asbestos. The oven back and the high closet are aluminized, giving them a light and neat appearance. The oven door is balanced, and the oven top is entirely covered with a cast iron grate filled with cement, which protects the steel and prevents the contents of the oven from burning on top. The front feed door falls to the level of the grate so as to admit large pieces of wood. The little pamphlet also shows the Twentieth Century Laurel parlor heater, made in 25 styles and sizes, and which is claimed to burn slack coal without smoke or soot.

Robinson Tubular Furnaces.

The Robinson Furnace Company, 107 and 109 Lake street, Chicago, have favored us with a copy of a new catalogue relative to Robinson's Tubular furnaces which they have just issued. The catalogue is a handsome publication, being not only the finest but the largest yet issued by this company. It comprises 64 pages. The headings and catch lines are printed in red, forming an attractive relief to the black letterpress.

First place in the catalogue is given to the type of furnaces distinctively known as the Robinson Tubular. These are full revertible flue furnaces, having radiators made with cast iron tops and bottoms, surrounded by vertical air flues, the whole being incased in a heavy sheet of refined steel in one piece. The vertical flues are the standard 3-inch, 4-inch and 5-inch wrought charcoal seamless boiler tubes, which are 24 inches long. Being exposed to the direct heat of the combustion chamber, the air passing through these tubes is highly heated. The smoke enters the pipe direct when the damper is open, but is forced entirely around the radiator when the damper is closed, thus making it a return flue radiator. These furnaces are made in five sizes, the series thus being available for all purposes, from small houses up to very large halls or churcehs. Full illustrated details are given relative to the various parts of these furnaces. Another style of Tubular furnace is made with the radiator construction entirely of cast iron, having no joints in the top. The radiator is corrugated, which adds greatly to the outer heating surface, while the flues are of heavy cast iron. The all cast Tubular furnaces are made in three sizes.

Another class of furnace is the Tubular Hot Blast, which is specially adapted to soft coal or wood. This furnace has a sectional gas ring arranged around the upper part of the fire pot for the admission of air, which becomes highly heated in its passage around the ring and then escapes into the fire pot through a large number of holes, thus causing more perfect combustion. This furnace has a stoel radiator and is made in four sizes. Another Hot Blast furnace is shown which is made entirely of cast iron and is furnished in three sizes.

The Robinson Reliable furnace, designed for either hard or soft coal, has a heavy steel radiator and an extra heavy dome, large at the bottom and drawn in at the top where the connection is made to the radiator bottom. This furnace is made in three sizes and is adapted to either hard or soft coal. The Robinson Tubular wood furnace, which is designed for wood exclusively, is a heavy serviceable furnace having a steel radiator and is furnished in two sizes. The Eclipse water heator is shown, by means of which any of the furnaces made by the company can be converted into combination hot air and hot water furnaces. A portion of the catalogue is devoted to hints on setting of furnaces, directions for making estimates and illustrations of furnace fittings. Numerous testimonials are also given.

Nickel Plate Stove Polishes.

The Nickel Plate Stove Polish Company, Chicago, are manufacturers of a variety of stove polishes and iron enamel, covering all the requirements of the stove and furnace trade. The stove polishes are made both in paste and liquid form. Their paste polishes are put up under the names of Black Jack, Black Eagle and Nickel Plate. These pastes keep moist and do not rust out. The liquid pastes are ready mixed preparations, which are put up in that form for those who prefer to have a stove polish ready for immediate use. Their iron enamel is put on the market under the name of Peerless and is adapted for use on stove pipes, grates, registers, coal hods, gasoline stoves, iron pipe, &c. It is ready for immediate use and dries quickly. The company have just brought out a handsomely illustrated catalogue containing colored reproductions of the packages in which each of these preparations is put up. A copy of this catalogue will be sent to any address on application. The company also state that they will send free samples of their stove polish by express, charges prepaid, to dealers who desire to test them.

ODD PLATES.

The Pittsburgh Stove & Range Company, successors to Bissell & Co., "who first made Stoves and other things in iron at Pittsburgh in the year 1829," have issued a neat folder carrying illustrations of some of the designs of Iron Linings which the company are making to complete their line of Peerless and Columbian Grates. The company state that they will issue a supplementary catalogue in the near future showing a new line of Grates, Iron Linings, Portable Baskets and Andirons, all designs being original, and were first modeled in clay by artists "whose hearts were in their work and whose taste and skill cannot be questioned."

The Kelsey Corrugated Warm Air Generator is the subject of an illustrated folder which is being distributed through the mail by the James Smart Mfg. Company, Limited, of Brockville, Ontario, who are Canadian agents for the Kelsey Furnace Company. In addition to an extended description of the Kelsey Generator, which is made in six sizes having capacities ranging from 5000 to 90,000 cubic feet, there are numerous halftone illustrations of buildings which are warmed and ventilated by means of it. There are also a number of testimonial letters from Canadian users, showing the satisfaction which the Generator gives wherever installed.

The Duquesne Mfg. Company, with principal office in the New Jersey Corporation Guarantee & Trust Company's Building, Camden, N. J., have been incorporated with a capital stock of $150,000 by Thomas Gunning, J. M. Arnold and M. J. Danin, to manufacture Stoves, Heaters, &c.

We have received from C. B. Halladay, manager of the Buffalo branch of the Thomas, Roberts, Stevenson Company, Philadelphia, a copy of a booklet which is being distributed with a double object in view. First, it is intended to call attention to a few of the many lines of goods which the company manufacture, and to invite the recipient to call at their Buffalo branch, located at 58 and 60 Broadway, and examine their line of Ranges, Furnaces, Gas Heating Stoves, Gas Ranges, &c. The second object of the little work is to give their customers and friends a fund of information regarding Buffalo and vicinity, and the Pan-American Exposition in particular, in as clear and correct a manner as is possible with a subject about which so much can be said. The company are sending out with the pamphlet a letter calling attention to their Buffalo branch, and stating that they will send a catalogue, describing their entire line of Stoves and Ranges, in case the dealer does not anticipate a visit to the city named.

Kennedy Brothers have about completed arrangements for the establishment of a Stove foundry at East Thomas, Ala.

As we go to press the midsummer meeting of the American Society of Heating and Ventilating Engineers

is being held at the Hotel Victoria, Chicago. Copies of papers which are to be read and discussed that have reached us are evidence that the meeting will not be without interest.

THE S. OBERMAYER FOUNDRY SUPPLY COMPANY, Cincinnati, Ohio; Chicago, Ill., and Larimer, Pa., have secured the contract for the entire equipment of the Etna Smelting & Refining Company's new plant, Cincinnati, Ohio, and among numerous other contracts one from the United States Government aggregating upward of $5700, for Seattle, Wash. The company's plant at Cincinnati was shut down for a brief period to make necessary repairs and for taking inventory; nevertheless it is expected that the month of July will be the banner month in the history of their business.

JACOB MYERS, father of William J. Myers and James Myers of the Union Stove Works, died at his residence in New York City, July 8, aged 73 years. The Stove trade will learn with regret of the loss sustained by these gentlemen and will join us in an expression of sympathy with them.

PETER B. ACKER, Union Stove Works, is enjoying a well earned vacation among the islands of the St. Lawrence River.

F. H. MOORE of the International Heater Company, Utica, N. Y., was a visitor at the company's New York office, 139 Water street, this week. In addition to a satisfactory trade for the season in their varied lines of Furnaces, Combination Heaters and Steam and Hot Water Boilers, Mr. Moore reports a growing trade for the Drake Acetylene Gas Generators, which the company are manufacturing.

J. M. LITCHFIELD, 105 Beekman street and 284 Pearl street, New York City, agent for the Mt. Penn Stove Works, Reading, Pa., is distributing, with the compliments of the manufacturers, a little notebook consisting of eight pages so treated with plastic slate as to be written upon by means of a slate pencil. The front cover is embossed in old gold upon a black ground, and carries the word "Notes," while the rear cover carries the inscription, "Compliments of Mt. Penn Stove Works, 105 Beekman street, New York City, J. M. Litchfield, agent."

THE ENTERPRISE STOVE COMPANY of Vincennes, Ind., are rapidly completing their new three-story building, which will be devoted exclusively to the production of Steel Ranges and Steel Cook Stoves. The structure covers an area of 30 x 100 feet, and the three floors will be used for stamping, mounting and finishing respectively. We understand that this new line of Steel Ranges and Cooks will possess many interesting features of construction.

SOME time since attention was called in these columns to the growing scarcity of steel, or rather to the difficulty of manufacturers in securing the necessary steel for making their Ranges. The situation has now assumed such a phase that the Schneider & Trenkamp Company of Cleveland, Ohio, announce that owing to their inability to procure the steel necessary in the construction of the Junior Gasoline Stoves, they will, until further notice, be unable to accept any orders for this class of goods. All orders for Stoves other than Juniors will, however, be received and have prompt attention as heretofore.

GURNEY & Co. of Boston, Mass., are sending out cards carrying an illustration of their Silver King Range, which is offered in two sizes. When the Stove is all black it is called the Iron King. It has been brought out in such shape that dealers can nickel their own Ranges. The price of each piece of nickel is fixed, and the dealer puts on the nickel to suit the customer. When the Range is full nickel plated it is called the Silver King. This scheme, we understand, has met with considerable success and has proved popular with the trade. The company state that they have introduced the idea to meet the requirements of those who desire plain Stoves, but who, after purchasing, want them nickeled, so they add a piece at a time.

WE have received a sample of the Felt Mats which are being furnished by the Michigan Stove Company, Detroit, Mich., to their agents, to be used for advertising purposes. The Mats are about 11 inches square and ⅛ inch thick and are well calculated to delight the heart of the housekeeper. They are ornamental in appearance, having the Garland trade-mark stamped in colors on one side.

THE CHARTER OAK STOVE & RANGE COMPANY, St. Louis, Mo., have issued catalogue D, giving a full description of their Charter Oak Furnaces. These Furnaces are made both with steel radiator and with cast radiator in three sizes. The catalogue, which contains a special price-list, will be sent to any dealer on application. The prices on these Furnaces are such as to be attractive to the trade. The Furnaces are illustrated in the company's full page advertisement, which appears in another part of this issue.

THE new foundry building of the Mountain City Stove & Mfg. Company, at the corner of Boice and White streets, Chattanooga, Tenn., was completed on July 2 and the work of installing the machinery is now in progress.

ANNUAL MEETING OF THE VULCAN CLUB.

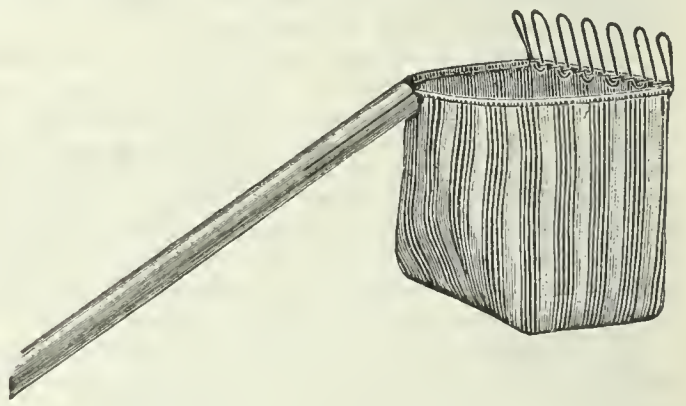
The second annual meeting of the Cleveland Furnace Dealers' Association (Vulcan Club) was held on the evening of June 27 in their club rooms in the Chamber of Commerce, Cleveland, Ohio. Reports were presented by the Auditing Committee, the secretary and the treasurer, which showed the club to be in a highly prosperous condition, with a comfortable cash surplus, notwithstanding the drain on the treasury of a three days' excursion to the Pan-American Exposition at Buffalo.

The election of officers to serve during the ensuing year resulted as follows: President, G. N. Bennett of the Bennett Furnace Company; vice-president, C. R. Holmes of the Holmes Furnace & Stove Company; secretary, E. F. Dettlebach of the Dettlebach Plumbing & Heating Company. The two last named were elected to their respective offices for the third time. These four officers, together with the retiring president, H. A. Smith, and J. C. Harrison, comprise the Board of Directors. G. G. Brown was elected sergeant-at-arms. Warehouse, Entertainment, Auditing and Legislative committees were appointed to serve during the year.

The club has renewed its lease of its present quarters in the Chamber of Commerce for another year. No increase in membership was reported during the past year, but a strengthening of tone was very apparent. The initiation fee has been raised from a purely nominal sum to a substantial amount, the club feeling that it is no longer necessary to offer bargain rates.

The Eclipse Fruit Picker.

The accompanying cut represents a fruit picker offered by D. B. Rock, Fairfield, Pa. The frame of the picker is made of one piece of number 9 tinned wire with



The Eclipse Fruit Picker.

loops or fingers at the top of the sack. The ends of the wire extend down on the handle and are secured in place by four staples. The sack is of bed ticking. The handle is 4 feet long. The picker is designed for gathering apples, peaches, pears, &c., and by its aid, it is remarked, the most delicate fruit can be handled without the slightest bruise. The device is referred to as neat, strong and durable, and as being comparatively low in price.

The M. & M. Combination Staple Puller and Fencing Pliers.

The Maxson & Maxson Company, West Edmeston, N. Y., are offering the combined staple puller, wire cutter, wire splicer, wire tightener, &c., shown in the accompanying cuts. The tool is forged from crucible tool steel, and is warranted against defects in material, temper or construction. The manner of pulling a staple is illustrated in Fig. 1. The jaws are so shaped, it is explained, as to easily grapple into the loops of staples,

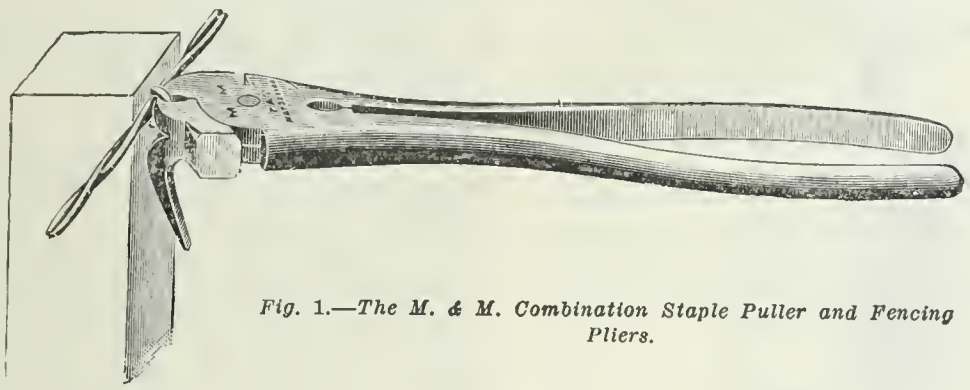


Fig. 1.—The M. & M. Combination Staple Puller and Fencing Pliers.

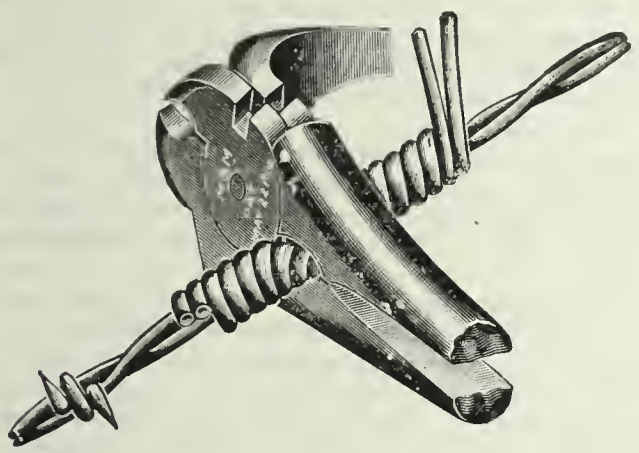

Fig. 2.—Wire Splicer.

and when the jaws are shut into the loop they force it well back from the points of the pliers in a strong portion of the jaws. It is pointed out that when drawing a staple the fulcrum is first at the upper portion of the horn, as shown in Fig. 1, where a powerful leverage is obtained, and as the staple is drawn and offers less

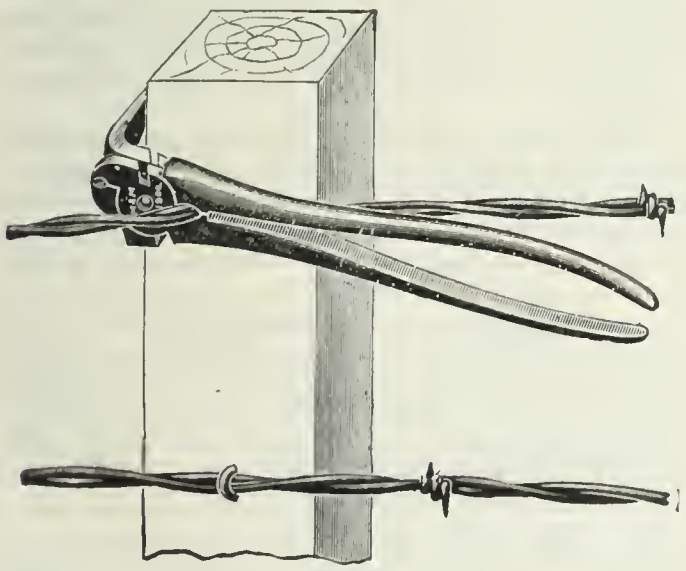

Fig. 3.—Wire Tightener.

resistance, the fulcrum point constantly moves further from the staple, and the staple is drawn without being bent, twisted or otherwise injured and may be saved for further use. To splice a wire the ends are placed in the splicing grip from opposite directions, when the grips are closed tightly, and the ends of the wire are wound around the main wires, as shown in Fig. 2. In Fig. 3 the process of tightening a wire is shown. The wire is grasped in the splicer grip and the horn is hooked on the side of the post. The handles of the pliers are then brought to the left around the end of the horn as a fulcrum, which strains the wire and brings the tool out of the way so a staple may be driven. The pliers may also be used as a wire cutter, a nail puller and a hammer.

Chicago High Speed Rotary Washer.

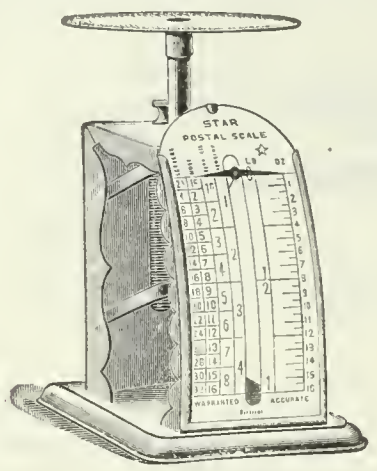
The New Century Washing Machine Company, 6 and 8 Wabash avenue, Chicago, Ill., are manufacturing the washer herewith illustrated. The machine is referred to as a high speed rotary washer, the cover of which is perfectly balanced by the fly wheel. The fly wheel

Chicago High Speed Rotary Washer.

may be turned backward or forward, doing, it is stated, excellent work both ways. The machine is devoid of clutches or springs, and, it is remarked, is light running, noiseless, and can be operated by a 10 year old child. The gearing is covered and the legs are bolted to the machine. The tub is made of white pine, with corrugated sides and bottom. Heavy steel hoops are placed at the top and bottom, and a heavy electrically welded wire in the center. The washer has a space for an 11-inch wringer, also a large opening for handling clothes

The Star Postal Scale.

The cut herewith shown is of a postal scale offered by the Pelouze Scale & Mfg. Company, Chicago, Ill. The scale is being made with a new frame, which is referred to as a great improvement over the old pattern. The scale weighs up to 1 pound by ½ ounces, and also gives the cost in cents of the amount of postage required for letters, books, merchandise and newspapers. The scale is 3 inches high, 2 inches wide and 3 inches deep, and is designed for ladies' or gentlemen's desks. The scales are furnished in nickel plate and oxidized copper.



The Star Postal Scale.

Cost of Doing Business.

The following communication from a Nebraska merchant in reply to an inquiry in a recent issue in regard to the cost of doing business will be interesting, as giving some details on the subject:

In your issue of June 1 I notice an article on the cost of doing business. Your contributor seems to be guessing in what he says. I wish to submit a few facts from my experience. I am a small average hardware dealer and have kept an accurate account of my business. I have an average of $3000 worth of stock and $2000 invested in a building in which to transact business, making a total capital employed of $5000. The sales for the year were $11,706.25; freight and drayage, $438.95; insurance on stock and building, lighting and all other expense items were $310.05, aggregating an actual expense of $749. I also figure an additional expense of 5 per cent. on building plus $15 a week for myself (this may be a little over), making an addition of, say, $850 to the $749, or a total of $1600 cost to sell $11,706.25 worth of merchandise, equivalent to about 14 per cent. I don't think there should be added any percentage on stock to the expense account, for the reason that all above the actual expense to sell the goods goes as interest on money invested in stock. I do not keep a clerk, but if I did his wages should be charged to expense account. The more business a man does to a certain extent the less percentage of expense, and if this clerk did not sell enough more goods, when I made up the expense account and ascertained the fact, he should not be kept. As the first writer has said, there are too many who do not allow enough for the expense account. There is a farming class who go into business and generally make a failure of it, as they figure on a 10 per cent. profit and calculate on no expense.

HARDY GREENWOOD, San Antonio, Texas, who is conducting a brokerage business in Iron, Steel and Hardware, acting as resident salesman on commission for manufacturers for whose products there is a demand in that city, is desirous of obtaining a few other accounts in addition to those he is now working. Among the lines for which he is looking are Tank and Stack Sheets, Tinware, Galvanized Ware, Hollow Ware, Wagon Material, Corrugated Roofing and Carriage Malleables. Some of the manufacturers for whom Mr. Greenwood is now acting are the Kansas City Bolt & Nut Company, Dillon-Griswold Wire Company, Diamond State Steel Company and Harrisburg Pipe & Pipe Bending Company.

Stove and Hardware Dealers.

J. F. BERNER, wholesale and retail dealer in Hardware, House Furnishing Goods, &c., 515 William street, Buffalo, N. Y., advises us that he will be pleased to extend any assistance that he can in the way of securing accommodations, &c., to his brother Hardware merchants who visit that city during the Pan-American Exposition now in progress.

WOOD & RAY, Hardware, Stove and Agricultural Implement merchants, Tyler, Texas, have dissolved by mutual consent, Mr. Ray retiring. G. B. Wood continues under his own name.

S. M. DAVIS has lately succeeded McBride & McIntosh, dealers in Hardware, Stoves, Tinware, Paints, Oils, &c., Covina, Cal.

W. J. GALLUP and Geo. Bowers, under the firm name of Gallup & Bowers, have lately entered the Hardware business in Sparta, Minn. Besides a line of Shelf Hardware they are carrying Stoves, Harness, Sporting Goods, Mining and Lumbering Supplies, Paints, Oils, &c.

WILLIAM O'BRIANT of Dublin, Texas, has bought out the Shelf Hardware, Tinware and Stove stock of J. F. Miller, Walnut Springs, Texas, and will continue at the old stand.

WOODS & BOYLE have succeeded Chevis & Woods in the Hardware, Stove, Agricultural Implement, Sporting Goods, Harness and Buggy business in Holton, Kan.

A 12-PAGE PAMPHLET has been gotten out by Chester D. Clapp of Toledo, Ohio, containing nearly 30 advertisements relating to Steel Ranges. The advertisements are nearly all original and have been used with success in Mr. Clapp's business.

THE LALANCE & GROSJEAN MFG. COMPANY, 19 Cliff street, New York, report an extraordinarily heavy demand for their Agate Nickel Steel Ware. The call for this high grade of Enameled Ware is heavier than ever before in the history of their business, and each recent month has shown an increase in the sales of these goods over those of the previous month. The company's factory at Woodhaven, L. I., is running full night and day, in order to keep pace with their trade. Consumers, this year, have shown a more marked inclination than ever before to buy the better and more expensive classes of Enameled Ware. The demand for the cheaper grades of this ware is also quite active, but it has not grown in correspondence with that for the higher grades.

THE occasion of moving into a new store building was utilized by the Poundstone-Refior Hardware Company of Ottawa, Ill., by issuing a well printed 12-page circular 9 x 12 inches in size to their trade. It was principally devoted to illustrations and descriptions of Hardware, Stoves, Ranges, Agricultural Implements, Carriages, Sporting Goods, &c. On the first page a view of the new building and portraits of Messrs. Poundstone and Refior were presented. Two pages and part of a third were devoted to a sketch of their "new home" and its different departments.

THE PARKER WIRE GOODS COMPANY of Worcester, Mass., have lately been organized for the purpose of manufacturing a line of Bright Wire Goods, Coat and Hat Hooks and Special Wire Goods. The company are a Massachusetts corporation with a capital stock of $10,000, all of which has been paid in. A. H. Parker, president and treasurer, has a thorough knowledge of the Wire Goods business and a large acquaintance with the trade, having been for the past 12 years connected with the Wire Goods Company of the same city in the capacity of salesman and general sales agent. The company will start manufacturing goods in a moderate way and increase as the business demands.

The experiment of driving a dynamo with power generated by a wind mill is said to have proved entirely satisfactory at Wittkiel, a village near Hamburg, Germany. The wind mill has a diameter of 39 feet with a wind surface of 526 square feet, and it drives a dynamo which furnishes a current of 120 amperes at 160 volts, when the speed of the wind exceeds 9 feet per second. The dynamo is also employed to charge the accumulators, which furnish a current of 110 volts used in lighting the town and driving a number of small motors.

THE SMOKE TEST FOR PLUMBING.

It is but a short time ago that the smoke test for detecting leaks in plumbing systems was spoken of only by the older and better informed plumbers. The apparatus and its application were alike unknown to many in the trade. Gunster & Forsyth of Scranton, Pa., have done not a little to bring this convenient method of testing plumbing systems before the trade in exploiting the Thomson smoke machine, which they manufacture and sell. The machine is intended to burn tarred paper, oily waste or any other similar material under slow combustion, so as to make a dense smoke. Then, by operating a lever, the smoke is slightly compressed, which forces it through a hose into either the fresh air inlet at the ground or the vent pipe at the top of the building, when all the other openings are closed. By continuing the operation of the compressor the smoke is forced all through the waste, soil and vent pipes of the plumbing system, and if there are any cracks, breaks or leaks the pungent odor of the smoke betrays the leaks, which are readily located, as the smoke can be seen issuing from the defect when search is made.

Many plumbers make a specialty of applying the smoke test to the plumbing in the buildings of their customers, particularly during the season when the families are away, so that they can test for leaks and make any repairs that may be neeessary. One of the advantageous features of the smoke test, however, is that it can be readily made when the family is occupying the house without interfering with their use of it. The greater interest taken in sanitary precautions makes it far easier for the plumber to secure the opportunity of testing the plumbing and put it in order than would have been possible a few years since. The possession of a smoke test machine and the intelligent use of it has brought many enterprising plumbers a large and profitable business, both in repairing and in new work.

COOLING DRINKING WATER.

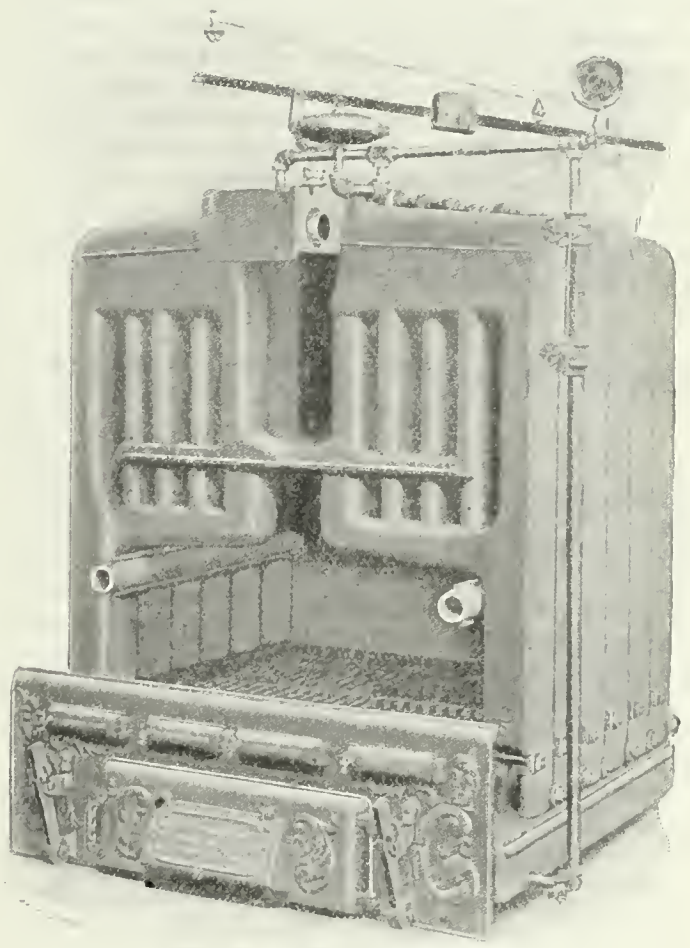
The question of cooling drinking water is no small one to those who run restaurants in large cities and hotels. Substantial assistance in the solution of this problem has been provided in the tin lined iron pipe made by Lamb & Ritchie of Cambridge, Mass. By means of a special process they clean the inside of iron pipe and thoroughly tin the surface, but not in the ordinary sense, for a quantity of tin is deposited which is almost as thick as the iron pipe itself. All are aware that tin has nothing in its composition to detract from the purity of drinking water, but that it will allow absolutely pure water to flow through it without any form of contamination. This makes a tin lined iron pipe admirably suited for being manufactured into coils to be placed either on the bottom or around the sides of tanks or vaults in which ice can be stored. The water, not coming in contact with the ice, is not contaminated with any impurities that the ice might contain, and having to flow through long pipes immersed in cold tanks, it is cooled to a very agreeable temperature for drinking. The firm make suitable fittings, also tin lined, for connecting pipes or for making coils.

The Ridgway & Tyler Company.

The corporation conducting a plumbing and heating business at 513 Union street, Schenectady, N. Y., under the name of the Harbison Plumbing & Heating Company, have, by consent of the court, changed their corporate name to the Ridgway & Tyler Company and will continue the business under this name at the same location but with new and improved facilities for conducting the same. Frank I. Mesick, who for the past 24 years has been engaged in the business and is now acting as sanitary engineer for Ridgway & Tyler at Albany, N. Y., will have special direction of the department of construction of plumbing and sanitation. Henry W. Blair, who is at present in charge of the heating and ventilation department, for the past 20 years has been engaged with the J. F. Pease Furnace Company of Syracuse, N. Y., and is thoroughly qualified in all branches of his work. He will have personal direction and supervision of all work planned and erected. John E. Harbison, formerly connected with the Harbison Plumbing & Heating Company, is no longer interested in the corporation, either directly or indirectly.

HENDERSON THERMO STEAM HEATER.

The accompanying engraving shows the Henderson Thermo Steam Heater, manufactured by the Prizer-Painter Stove & Heater Company, Reading, Pa. The general construction is the same as in the Henderson Thermo water heater and steam requirements are met by changes in the sections. In both heaters the sections are divided in the middle and extend only half way across the heater. This insures freedom to expand and greatly reduces the liability of breakage. Each section is connected to a top header and to a water base. The sections



Henderson Thermo Steam Heater.

are not connected to each other and any one may be easily removed without disturbing any other part of the heater. This is urged as a great advantage over sections which extend clear across the heater and are connected to each other. The connections are slip nipples of malleable iron, the castings being drawn together over the nipples by short bolts outside the waterways and away from the fire. These joints are easy to tighten, easy to take apart and durable. The top header is sunk between the upper ends of the sections and the sections connect to the sides of the water base. For convenience in handling and to insure freedom from breakage the base is made in three castings, two sides and a back, connected by 5-inch slip nipples.

The grate is of the rocking and dumping type, the number of grate bars corresponding to the number of heater sections. Three widths of the heater are made in which the grates are 19, 28 and 41 inches wide. The 41-inch grate is divided into two parts which are operated separately. By means of a pawl the rocking is limited to the movement necessary for ordinary shaking, but by turning the pawl the bars may be turned upright, and the contents of the grate dumped into the ashpit.

The engraving shows the heater without the front section. The intermediate section has three horizontal

waterways and the middle one forms the crown sheet. After striking the crown sheet the draft passes up through the vertical flues at the outside of the heater, then travels laterally between the tubes to the large central flue and then back to the smoke pipe. The tubes above the crown sheet are staggered so that the gases must follow a zigzag route, while they strike the heating surface at right angles. The proportion of fire surface, flue space and grate area is exactly the same in all sizes of the heater. From front to rear of the heater the tubes are in straight rows, and all surfaces are easily reached with a cleaning brush.

The upper part of each steam section is a liberating chamber, the water line being carried at about the middle of the gauge glass. An independent circulation of water takes place within each section and this is facilitated by diaphragms in the outer water legs which provide separate passages for ascending and descending currents. A special feature is shown in the horizontal tubes inside the fire pot. These connect with openings in the front of the heater and bring in air which is heated in the tubes and discharged into the combustion chamber. It mingles with the burning gases and furnishes the oxygen which they require for thorough combustion, burning gases which would otherwise pass unburned to the chimney. The Manufacturers' Catalogue No. 4, just issued, not only describes in detail the Henderson Thermo steam and water heaters and shows many fine engravings, but is a book which should be read by every heating contractor for its suggestions and general information.

THATCHER STEAM AND HOT WATER HEATERS.

Printed in black on a two-shade effect in green, the Thatcher Furnace Company, 240 Water street, New York, are sending to the heating trade a 32-page catalogue devoted to the Thatcher steam and hot water heaters. The introduction calls attention to the long experience of the house in manufacturing high grade heating apparatus, and to the extension of their plant and its equipment with all the necessary appliances for manufacturing high grade steam and hot water heaters. A page is devoted to the company's terms and to suggestions for ordering goods. The opening portion of the catalogue is occupied by the Thatcher sectional steam and hot water heaters. These heaters are of the vertical sectional return flue type. The sections are connected by means of manifolds with screw joints outside of the heater, so that they are readily accessible but not subject to the action of the fire. The arrangement of the waterways is such as to facilitate circulation and to present a large surface to the direct effect of the fire. These heaters are made in 12 different sizes rated to carry from 650 to 4040 square feet of direct steam radiation.

The next heater shown is a new production which is called the Comfort, owing to its qualifications to provide a satisfactory temperature in residences. This heater is of round form, with a large combustion chamber into which a series of lobes or projections extend with the object of bringing a larger amount of heating surface where the full effect of the fire will be upon it, thus increasing the efficiency and economy of the heater. It consists of an ash pit and fire pot and combustion chamber and upper section, so that it is readily handled, and it is made with grates 24 and 28 inches in diameter. The capacity varies from 550 to 975 square feet of steam radiation, according to the number of upper sections that are used in the heater.

The Empire heater, which is well known to the trade, is also shown by means of broken views, and its merits attractively presented in the text, while tables give the ratings for both steam and hot water. The Champion steam and hot water heater, which combines the merits of the vertical sectional and the horizontal tubular constructions, is also displayed by means of broken views, the text and details showing that it is well adapted for large work. The Sterling tank heater and laundry stove occupy two pages, and another page is devoted to the Thatcher combination hot air and hot water heater, which is made in six sizes and well adapted for fine residence work. An engraving shows a horizontal hot water heater suspended from the ceiling and connected with a Sterling hot water heater for summer use, and also connected with a rear section of a Thatcher steam heater for winter use. By this means the labor and fuel for an extra water heating apparatus are avoided during the winter season. The last three pages contain useful information on apportioning radiation and determining the size of both steam and hot water heating apparatus.

New Pipe Mills.

The S. R. Smythe Company, engineers and contractors, Park Building, Pittsburgh, are building at the present time no less than eight independent pipe and tube mills in different parts of the country. These new mills, with the daily capacity of each, are as follows:

	Tons.
Eastern Tube Company, Zanesville, Ohio	500
Wheeling Steel & Iron Company, Benwood, W. Va	400
Coatesville Rolling Mill Company, Coatesville, Pa	60
United States Tube Company, Buffalo, N. Y	60
Carnegie Tube Company, Carnegie, Pa	50
Longmead Iron Company, Conshohocken, Pa	50
Alabama Tube & Iron Company, Birmingham, Ala	50
The Aermotor Company, Chicago Heights	90

In addition to the above the Youngstown Iron Sheet & Tube Company are building large mills at Youngstown, Ohio, to roll iron tubes, and will have a capacity of about 300 tons a day. The La Belle Iron Works at Steubenville, Ohio, are building new steel pipe mills and will turn out from 200 to 250 tons per day. These independent mills will therefore have a daily capacity of close to 2000 tons of pipes and tubes.

The Heating, Ventilating & Foundry Company.

The Heating, Ventilating & Foundry Company of Pittsburgh have just completed the erection and equipment of a new and model foundry and machine shop at Lazearville, W. Va. The main building is 65 x 145 feet, and is arranged on the continuous plan. A private siding on railroad switch runs along the full length of the building. The raw material, such as iron, coke, &c., is unloaded from cars onto a platform and into sheds, surrounding the cupola, which has a melting capacity of 5 tons per hour. This cupola is located on the side of a molding room, and is equipped with all the latest improvements in cupola practice. Directly in front of the cupola and about 25 feet distant is situated a 2-ton jib crane, for handling large ladles of iron and heavy castings. After the castings are made they pass into the tumbler and emery room, adjoining the molding room, where they are cleaned and ground, and if the castings require machine work, they pass into the machine shop, and then into the store or ware room. In case no machine work is necessary the castings pass directly into the storage room, from where they are loaded into cars, ready to ship. There is no rehandling of either the raw material or the manufactured goods. The power used for running the blower for cupola blast, elevator, cleaning barrels, emery wheels, drill presses, lathes, planers, &c., is furnished by two 25 horse-power gas engines, which are so arranged that they can be run separately or together. The whole plant will be heated and ventilated by what is known as a mechanical furnace system, consisting of large horizontal furnaces, made by the company, for heating and blowers for circulating the air, both for winter and summer. The offices consist of four rooms, two rooms on the ground floor and two above. These offices are heated and ventilated by a fire place system, with apparatus made and controlled by the company. The product will be about 5 to 10 tons per day, and will be increased as fast as possible.

PEDEN & Co., 207 Main street, Houston, Texas, are adding to their stock a full line of Steam Fitters' Tools, Supplies, Packing, Belting, &c., and will be pleased to receive catalogues and quotations from the manufacturers of such goods.

New York City Notes.

The trade sympathizes with President I. J. Brown of the New York City Association for the loss he has sustained in the death of his father, which occurred last week, at the ripe age of 89 years.

* * *

The annual outing of the Manhattan Branch will take place at Bayside, L. I., on Wednesday, July 24. The programme of sports includes baseball, shooting, fishing and swimming matches for valuable prizes. Tickets can be obtained from John Renehan, 163 East Thirty-fifth street, the treasurer, or from any other member of the committee.

* * *

The labor question has not been settled yet and strikes are occurring, on jobs where a hold can be gotten, to settle the supremacy of the warring factions of journeymen. No final settlement is yet in sight.

* * *

Trade still continues quiet, although there are many jobs given out which are not ready for the plumbers yet.

* * *

Milton Schnaier is doing the plumbing in the Towers Apartment House at the southeast corner of Riverside Drive and Eighty-fourth street. This is one of the finest apartments in that vicinity, rents running from $2000 to $10,000 a year.

* * *

One of the best jobs in the city is the Mount Sinai Hospital, which is to occupy the block between 100th and 101st streets and Fifth and Madison avenues. Bids are now in the hands of the Building Committee and there is considerable speculation as to who will be the lucky man.

Trenton Potteries Company.

The Trenton Potteries Company of Trenton, N. J., have an exhibit of their wares at the Pan-American Exposition, at Buffalo, which is located in the Liberal Arts Building, Department of Sanitation, where they are distributing a pamphlet showing on the outside one of their elliptical lavatories, made from solid porcelain. The pamphlet contains a list of the jobbers in the United States, Canada, Great Britain and Australia who handle their wares, and the Pottery Company refer all visitors and inquiries for information regarding the price of their wares and the cost of installation of them to the nearest jobber in the locality from which the visitor comes. The list of jobbers in the United States is practically a reprint of the pamphlet issued by the Confederated Supply Association, and is the official list of the legitimate jobbers of plumbing supplies in the United States. The list of jobbers in Canada is a very complete one, and is made up from the firms who are direct customers of the Trenton Potteries Company. The sanitary earthenware manufactured by the Trenton Potteries Company is not excelled by the product of any pottery, foreign or domestic. The finest sanitary wares are now produced in the United States. The product is not only superior in durability and finish, but the sanitary devices and appliances made here are far in advance of any foreign goods now on the market.

Water Heaters for Summer Use.

There is no time of the year when the instantaneous water heater is a greater convenience to the owner than during the summer, when the family are away from home. It is often the case that a few occupants use the house for sleeping purposes, and when they find the bathroom without a hot water supply it is devoid of one of its greatest conveniences. W. J. Adam of Joliet, Ill., has produced in the Victor Instantaneous Water Heater a device which is intended to overcome this difficulty. Being adapted for the use of gas as a fuel, it is a simple matter to turn on the gas and have the water heating begin at once. The capacity of the apparatus depends on the temperature of the water desired. Ordinarily, it will heat the water to a suitable temperature for bathing as fast as it will run from the faucet through the water heating coils.

The convenience of such an apparatus suggests that plumbers, stove dealers and hardware men would add profitably to their business by displaying a water heater and explaining its uses. In fact, it has been pointed out by those who have done a successful business in water heaters that it is not a seasonable article, but is as well adapted for sale and use in the winter season as in the summer. This is particularly true in houses which have their heat supplied from street mains, or in which a caretaker keeps up the fire in the heating apparatus. In the absence of the fire in the kitchen, with the gas instantaneous water heater, hot water may be secured for a bath in a very few minutes.

Heating and Plumbing Notes.

"Trenchant Truths" is the title appearing upon a little folder that is being sent out to the trade by the Berger Mfg. Company, Canton, Ohio. The inside of the folder bears in typewritten lettering an ingenious and convincing plea for the use of the company's Twentieth Century Corrugated Steel Pumps. It is claimed that a dealer can do more business, a better business, make more money and make it faster with these Pumps than with other goods of the kind.

In the interest of the Drake Automatic Acetylene Generator the International Heater Company of Utica, N. Y., are sending to the trade a letter received from Captain Mercer, acting agent for the new Department of Indian Affairs at Leech Lake Agency, where the Indian School buildings are illuminated by a Drake Automatic Acetylene Gas Generator. The Captain's letter says the Generator has given entire satisfaction and that the light is very fine.

Frank D. Ellison, plumber, is now located in his new quarters at 706 Main street, Hartford, Conn.

J. W. Hunt & Co., Providence, R. I., have contracts for the plumbing and heating of 22 houses, in which they will use Glenwood Boilers.

I. Seymour Crane, Montclair, N. J., bid $5467 and secured the contract for the plumbing and sanitary improvements for the east wing of the Montclair Penitentiary.

Thomas Logan, a master plumber, and J. S. Mallett, a journeyman plumber, have been appointed on the Board of Plumbing Examiners of Bridgeport, Conn.

Frank L. Avery has been elected plumbing inspector by the Board of Health of Holyoke, Mass., to replace Joseph Murray, who resigned some weeks ago. The office carries a salary of $1100.

President Meredith of the Canadian Association of Master Plumbers in his report at the recent Toronto convention made the following recommendation: "Let us educate our members to rather endeavor to do first-class work at a fair price than to contract at such a price that scamp work is the result." It is advice that can be followed with advantage.

The Central Supply Company, recently organized as a corporation under the laws of Massachusetts, have opened a large store at 35 and 37 Waldo street, Worcester, Mass. The new concern will deal in Steam, Gas, and Water Supplies and contract for steam heating and power plants. The store is about 40 x 60 feet, with a large storeroom under the Waldo House. The officers of the company are: President, Ira P. Smith; treasurer and manager, J. P. Ashley; directors, Ira P. Smith, C. L. Waite, J. P. Ashley. The men in charge of the business have long experience, excellent facilities for displaying their goods and fine equipment for constructing steam heating and power plants.

A plumber of Richmond, Va., who had trouble with his men who went on a strike, has sold all of his plumbing contracts to a Western firm, who have taken their men to Richmond and are now completing the work. The striking plumbers refuse to submit the question at

issue to the International Executive Board, which induced the sale of the contracts.

In announcing the incorporation of the Locke & Smith Company of 103 and 105 West Thirty-seventh street, New York City, an error was made in naming the directors, who are: H. M. Smith, William E. Lawton and Albert J. Pearson.

L. L. Bassett, artesian well driller of New Haven, Conn., who has successfully completed two wells for the Y. M. C. A., has just taken the contract for sinking four more wells at the new building on Temple street, that city.

D. R. Sperry & Co., Batavia, Ill., are sending to the trade a seasonable circular devoted to their Lead Melting Furnaces. It is the time of year when large gas and water mains, as well as drainage systems, are being laid and large quantities of lead are used for calking the joints. One of the furnaces is mounted on wheels so as to be readily moved, and has a capacity of 750 pounds of molten lead. It is made of boiler steel having a cast iron fire pot, and the smoke pipe is securely connected with the shell. The Furnace is also made without the wheels, but provided with heavy loops to enable the Furnace to be carried by meaus of poles. Special cast iron Ladles adapted to the use of pipe layers are also shown.

The Pierce, Butler & Pierce Mfg. Company of Syracuse, N. Y., are sending to the trade a 16-page catalogue devoted to the Pierce Vertical Vent Closet. The catalogue is illustrated with half-tone engravings showing siphon jet closets with both high and low down flush tanks and their special vertical vent. The vent is shown to be of larger bore than heretofore used for local vent purposes and special stress is laid on the fact that the outlet or vent rises immediately in connection with the closet, inducing an up draft for ventilating purposes. It is also claimed that the location of the vent makes it impossible to become clogged or overflow. To those who cater for high-class custom trade this catalogue will be of special interest.

The Committee on Sewers of Bristol, R. I., has been authorized to extend the present system of sewers. The probable cost of the new work is $58.000.

T. B. Walmsley, Woodcliff, Bergen County, N. J., in addition to making a specialty of Lead Burning, also manufactures Lead Burning Apparatus and a compound Blow Pipe for lead burning and soldering with illuminating gas. This Blow Pipe has been found a great convenience by many plumbers in lengthening traps and doing lead burning, where gas can be had. Mr. Walmsley has recently shipped one of his lead burning machines to a customer in Henderson, Ky., and as his apparatus becomes better known his trade is gradually increasing.

George Callahan & Co., 218 Front street, New York, are sending to steam fitters and plumbers blotters calling attention to Callahan's Old Reliable Steam Joint Cement. The Cement is sent in the form of a dry powder, to be mixed when needed for use with pure boiled linseed oil. It is claimed that the joints can be easily separated at any time, leaving the thread clean and rustless, an advantage over red lead, in addition to which it is cheaper. It is stated that the cement will stand 300 pounds pressure on 18-inch flange joints, a test of several years demonstrating this fact. The house also make a specialty of Oils, Roof Cement, Roof Paints, Soldering Fluids and Plumbers' and Tinners' Sundries.

T. J. Cummins, 1035 Third avenue, New York, has recently installed a complete system of lead drainage pipe to dispose of the acids used in the power house of the street railroad company at Second avenue and Sixty-fifth street. All of the joints and seams were made by lead burning, Mr. Cummins having employed Thomas B. Walmsley, Woodcliff, Bergen County, N. J., the well-known expert, to do this part of the work for him.

G. P. Williams, manager for the St. Louis Stamping Company for 18 years before they were merged in the National Stamping & Enameling Company, and who has been employed with the last named corporation for the past 18 months, has established an office at 253 Broadway, New York City, where he represents a number of firms as their Eastern agent. Among the concerns represented are: Hall & Carpenter of Philadelphia, the Jacob J. Vollrath Mfg. Company of Sheboygan, Wis.; the Tea Tray Company of Newark, N. J., and the Sozo Supply Company, manufacturers of metal and silver polish. Mr. Williams is the secretary of the Sozo Supply Company.

Architect George H. Gilbert is preparing plans for a $65.000 school building to be erected on Weathersfield avenue, Hartford, Conn.

The Canadian master plumbers hold a liberal view as to what constitutes a master plumber, as may be seen from the definition recommended by Alderman Lamarche of Montreal in an address at the recent master plumbers' convention at Toronto. He held a master plumber to be one who works in the plumbing, steam fitting and gas fitting lines, roofing, tinsmithing and is a member of any local association. He further explained that a plumber should not be debarred from joining a local association because he also engaged in steam fitting or roofing.

The United States Radiator Company of Dunkirk, N. Y., announce the appointment of Walter S. Appleton as acting manager of their New York branch, occupying offices in the Park Row Building. Harry S. Martin will return to the home office, where, as assistant general manager, he takes charge of the sales department.

A special supplement to the *Herald* of Southbridge, Mass., presents a portrait of George C. Winter and speaks of the enterprise which he has displayed in building up the different branches of trade in which he is engaged. Mr. Winter carries a complete stock of Hardware and Stoves, has a well equipped Sheet Metal working shop, makes a specialty of plumbing, steam and hot water heating and hot air furnace work. The business was established in 1865 by his father, George L. Winter. After 25 years' experience in the management of his father's business George C. Winter succeeded him in 1900.

Apropos of the recent hot spell the Baltimore *American* presents the following, which will be appreciated by the trade: "Mr. Topfloor, Dear Sir—Replying to your favor of January 15, stating that you must have more heat in your flat, I take pleasure in informing you that the entire building is now thoroughly heated, and in expressing the hope that you are satisfied. Mike Muggins, Janitor. July 9, 1901."

The report has obtained currency that the National Tube Company are to absorb the Shelby Steel Tube Company, the identity of the latter being lost. This is not correct. The United States Steel Corporation acquired the Shelby Steel Tube Company through an exchange of securities, and the National Tube Company will operate the Shelby Steel Tube Company under a contract with the United States Steel Corporation. There will be, however, no merger of the National Tube Company and the Shelby Steel Tube Company.

Cleveland Galvanizing Works, Cleveland, Ohio, are now prepared to furnish a line of Galvanized Steel Pump Tubing and Galvanized Iron Curbs in connection with their Pump Chain and Rubber Buckets. They refer to the Curbing as thoroughly galvanized throughout, making it absolutely rust proof. The Tubing is also guaranteed not to rust.

The contract for equipping the County Insane Asylum at Sheboygan, Wis., has been awarded to the H. Mooers Company of Milwaukee for $5315.

The plumbers at Easton, Pa., are on a strike on account of dissatisfaction with the attitude of the master builders toward the striking bricklayers and plasterers.

Melvin Yost of Bendertown, Pa., a pump maker, while cleaning *débris* from a well this week was overcome by gas while being drawn to the surface and fell into the well and was drowned.

Fifty union steam fitters of the 150 journeymen in Worcester, Mass., have gone on a strike for an eight-hour day and a minimum wage of $3.25 per day. Their employers are now paying $3 for a nine-hour day.

New Firms and Changes.

A. W. Gearhart and George R. Evans have formed a partnership in the plumbing and gas fitting business at Fresno, Cal.

M. R. & N. G. Pierce, who have carried on a plumbing business for a number of years at Springfield, Mass., have dissolved partnership. N. G. Pierce retiring. Charles F. Peck, who had been in the employ of the old firm for several years, has become a partner with M. R. Pierce under the firm name of M. R. Pierce & Peck.

The Harbison Plumbing & Heating Company of Schenectady, N. Y., have filed a certificate of change of name to the Ridgway & Tyler Company. Frederick W. Ridgway of Albany, N. Y., is the president of the company.

The Gibson Heater Company have been incorporated at Muscatine, Iowa, with a capital of $2500, with J. H. Munroe, president, and F. B. Munroe, secretary.

The W. H. Denslow Company have been incorporated at Waverley, N. Y., with a capital of $20,000, by W. H. Denslow and C. P. Hutchins. The company will manufacture the Denslow Combination Steam, Hot Water and Hot Air Heater. Ground has already been broken for the foundry building, which will be 40 x 80 feet in size.

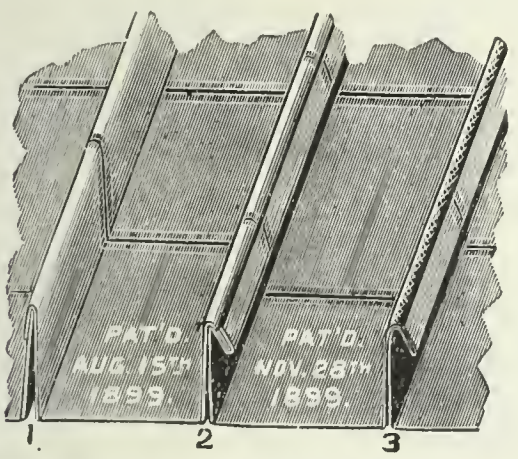
C. L. Grant, artesian well contractor, of Providence, R. I., announces that he has purchased the business of Henry E. Corbin and the Wynne Machine Company in that city and will continue in the same line, being the agent for the Aermotor Wind Mills, Towers and Pumps. His headquarters are at 17 Byron street, Providence.

D. Saunders' Sons, Yonkers, N. Y., manufacturers of Pipe Threading and Cutting Machinery, have incorporated under the same name.

The Stafford & Ward Company of Jacksonville, Fla., have been incorporated with a capital stock of $5000, to conduct a general plumbing business.

REESE'S SOLDERED STANDING JOINT.

E. L. Parker & Co., 201 and 203 South Charles street, Baltimore, Md., advise us that the Reese's soldered standing joint, of which they control the patent, is being very



Reese's Soldered Standing Joint.

widely used in putting on tin roofs in the district in which the firm operate. The joint, which is illustrated in the cut given herewith, is claimed to make a perfectly tight roof. Another advantage obtained by the use of the joint is that the roof can be made nearly flat, only sufficient fall being given to allow the water to flow gently into a gutter, thus enabling more space to be secured in the building. The joint, it is stated, makes it impossible for the roof to leak, as it expands and contracts, while the plates used cannot separate at the joints. It is described as easy to put on and as having advantages over the ordinary flat seam or rib roof. The company say that the joint is specified by a large number of architects in their city, and that it has been used upon some of the finest buildings in Baltimore.

It is reported that the Ohio Falls Iron Company of New Albany, Ind., are contemplating the erection of a new Sheet mill.

FLASHINGS.

The Muskegon Tin & Novelty Company, Muskegon, Mich., have been organized with a capital of $50,000 to manufacture Tin Cans, Baking Powder Cans, Pill Boxes, Bread Trays and other Tin Goods. The promoters expect to have the enterprise in operation within 60 days, employing 75 to 100 men. The local Chamber of Commerce has offered the new company substantial encouragement.

The contract for the roofing and metal work for the power station for the Worcester & Blackstone Electric Railroad Company, at Millbury, Mass., has been let to the What Cheer Roofing Company, Providence, R. I. Twelve thousand feet of gravel roof will be required.

The National Can Mfg. Company of Brooklyn, N. Y., have been incorporated with a capital of $200,000. W. H. Hibbard, H. E. Hutchinson and H. Wilson are the directors of the concern.

The Toledo Machine & Tool Company, Toledo, Ohio, manufacturers of Presses, Dies, Punches, Shears and other Sheet Metal Tools, have shipped a number of Press Punches to England and Scotland, and have been awarded a contract by the United States Government for the Presses for the machine shop that is being equipped at the Government Arsenal, at Rock Island, Ill. The concern made shipments in June of nine full carloads of special machinery, in addition to a large number of smaller shipments.

Clark, Quien & Morse, Peoria, Ill., wholesale Hardware dealers and manufacturers of Eave Trough, Elbows, Washing Machines, Plecker's Corrugated Conductor Pipe, &c., have increased their capital stock to $100,000 from $75,000.

The Waukesha Steel Sheet Company have been organized at Waukesha, Wis., with a capital of $250,000, by J. E. Jones of South Chicago, F. J. Patterson of Cleveland, Ohio, and F. E. Ryan of Waukesha. They will build mills for rolling Steel Sheets and Black Plate for tinning. They expect to have three mills running on Black Plate by October 1, and to be making Tin Plate by December 1. A. M. Crane & Co., the Rookery, Chicago, will sell the product.

The Carnahan Tin Plate & Sheet Company have taken out a New Jersey charter with a capital of $500,000. This concern are building Tin Plate and Sheet mills at Canton, Ohio, the contract for most of the equipment being given to Edward E. Erikson, consulting engineer, at Pittsburgh. The plant will consist of six Sheet mills and six Tin mills, and there will also be a stamping works. Active work is now going on and the company expect to be in the market with their product in the latter part of this year.

H. Weiss & Co. have been organized as successors to the business carried on until recently by the Tinners' Machinery & Supply Company at 20 Cliff street, New York. The firm is composed of H. Weiss and Albert Hild. Mr. Weiss has been connected with the Tinners' Machinery & Supply Company and their predecessors for the past ten years and is thoroughly conversant with all the details of the business. The company deal in Tinners' Machinery, Tools and Supplies of all kinds, Skylight Gearing and Plumbers' Tools, and carry a large stock of these goods, which are well displayed in their spacious wareroom.

Under the title of "Coercive Trade Unionism as Illustrated by the Chicago Building Trades Conflict," James A. Miller, the well-known Chicago manufacturer of Sheet Metal Roofing and Spouting, has contributed a masterly article to the *Journal of Political Economy*, Chicago. This article is dispassionately written, and is one of the best presentations of the facts in the great strike of 1900 that we have yet seen. It is not only historical but also enters into the legal aspects of the conflict and gives much valuable information relative to the legal rights of employers and workmen. Mr. Miller displays as great ability in handling his pen as in working sheet metal, being equally at home in either line. The article has been reprinted in pamphlet form for general distribution.

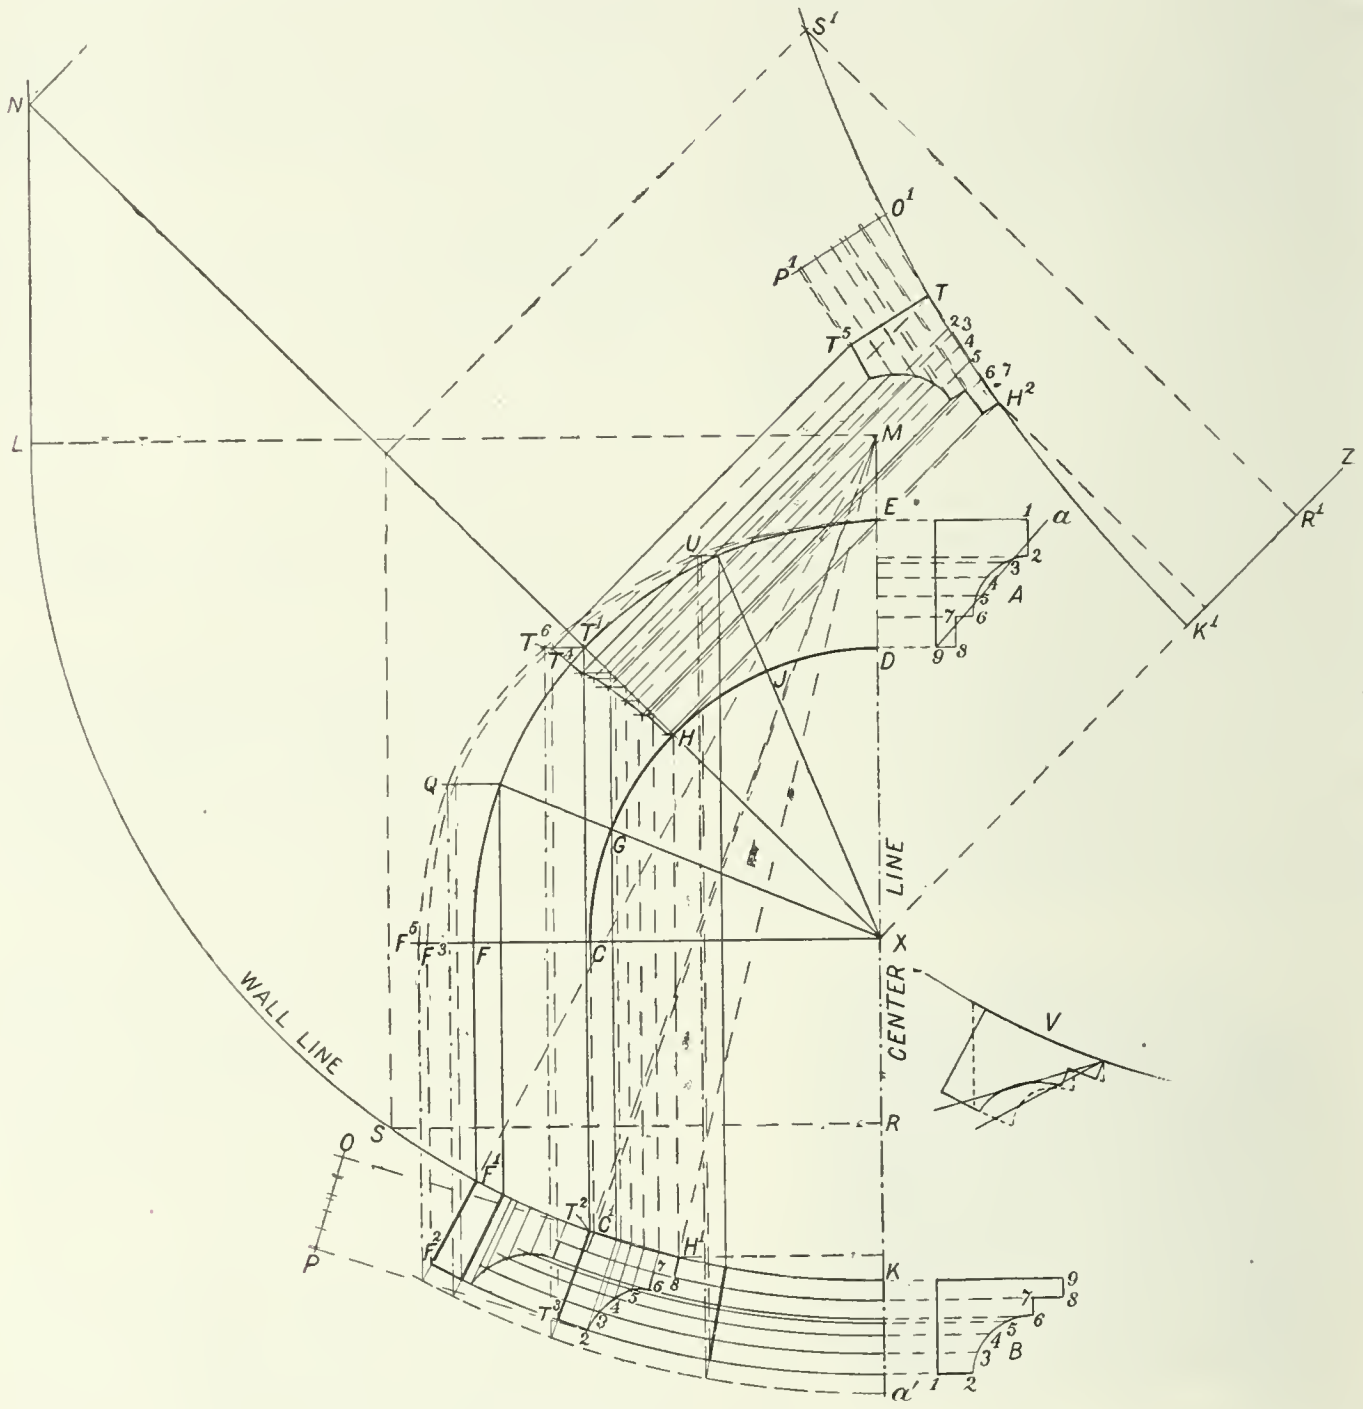
Problem 218.

PATTERN OF THE BLANK FOR A CURVED MOLDING IN AN ARCH IN A CIRCULAR WALL.

BY GEO. W. KITTREDGE.

The last problem of the "New Metal Worker Pattern Book," bearing the above title, is introduced in that work as a final mention of the great variety of conditions which may exist in the construction of arches in curved walls. The demonstration is written in general terms showing how principles explained in previous problems may be applied. The diagram there given shows the moldings of a semicircular arch in a curved or cylindrical wall whose radius in plan is probably three times that of the arch. The moldings, having a profile similar to that shown at A, Fig. 1, of the annexed diagrams, are carried around the opening of the arch in such a manner that the soffits, or those portions which are horizontal in that section, remain parallel to the center line of the plan throughout their course, as shown by a plan at the springing line. In the latter part of the second paragraph of the demonstration it is stated that the soffits above referred to might, with equal propriety, have been drawn radially toward the center of the curve of the wall in plan, and that in such case the profile would remain nearly normal at all parts of the arch.

A correspondent at Orange, N. J., wishes to be shown how to develop the patterns under the latter conditions, or with the lines drawn radially. He gives evidence of having studied the "New Metal Worker Pattern Book" pretty thoroughly, and will, no doubt, be able to make the applications referred to in the problem in regard to developing the pattern for the blank after its flare at the various parts of the arch has been determined. The flare of the blank, as the sides of the arch are approached, under these conditions will, of course, be much increased over that of a blank for a mold whose soffit remains parallel to the center line of the plan, as in the problem. A comparison of the profiles of the arch at the springing line drawn according to the two methods under consideration is shown at V of Fig. 1, the different flares of the blanks being shown by the oblique lines. Although, as above stated, the profile of the arch, according to our correspondent's requirements, would remain nearly normal throughout its course, yet certain changes must take place, and a sufficient number of profiles or stays will have to be raked, not only as a means of determining the flare and thereby the plan and elevation of the blank so that it may be triangulated, but also as a means of constructing a templet for use in raising the mold, such as that shown in Fig. 744 of the "New Metal Worker Pattern Book."



Problem 218.—Fig. 1.—Method of Developing Profiles for an Arch in a Curved Wall.

of the arch, one-half of which, shown by C D, is a semicircle in the elevation, and that a section upon its center line is that shown at A. The plan of the wall against which the moldings of the arch are placed is shown below, the center from which the curves are struck being at M. First drop a perpendicular from the point C, cutting the inner line of the arch in plan at C^1. Divide the curved portion of the profile A into any convenient number of equal spaces and project lines from its several points and angles to the center line of the arch, as shown from D to E. Now set off the several spaces in D E upon the plan, beginning at C^1, as shown from C^1 to F^1, and erect the perpendicular from F^1, cutting the springing line of the arch at F. It will be noted that on account of the obliquity of the lines of the plan at this point the distance F C is less than E D. For the same reason the width of the arch mold, as measured on the surface of the wall in the elevation, upon lines radiating from the center X, must apparently decrease from the center toward the base as the obliquity of the wall increases. These widths can only be determined as the sections upon the several lines assumed are developed.

To develop the profile of the arch on the springing line, first place a duplicate of its profile A in such a po-

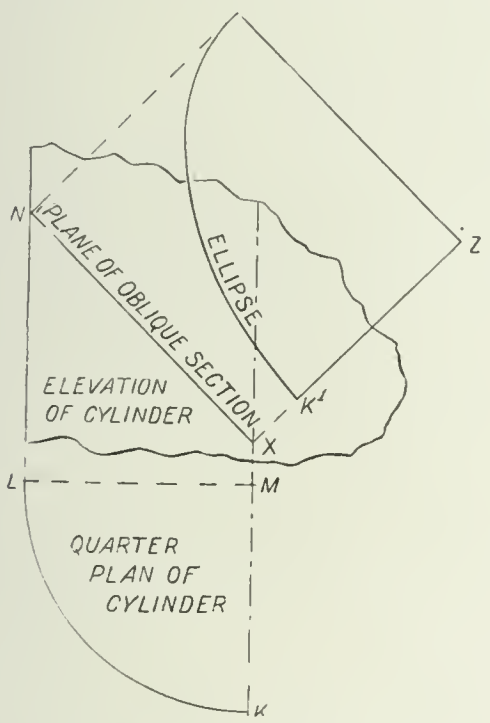


Fig. 2.—Reduced Diagram, Showing Relation of Parts in Fig. 1.

sition in the plan that the lines of projection shall be parallel to the center line, and that its wall line shall coincide with the wall line of the plan, all as shown by B. Divide the curved portion into the same number of equal spaces as at A, and from the several points and angles project lines upon the center line, as shown, and thence carry them around the center M indefinitely. Now from the center M draw radial lines through the several points between C^1 and F^1, cutting the arcs of corresponding number just drawn. A line traced through the points of intersection, as shown from F^2 to C^1, will give the desired profile.

Divide the curve C D of the arch into any convenient number of spaces, as shown by the points G, H and J, through which draw lines from the center X indefinitely, these lines representing the planes upon which it is desired to construct sections of the curved wall, and against them profiles of the arch molding. The method of constructing the sections upon these lines is necessarily more complicated than that employed at the springing line, for the reason that the sections, being oblique to the axis of the cylindrical wall, are necessarily elliptical in outline. It is advisable to make these sections as few in number as will define the course of the mold, as after an elevation and plan of the blank have been obtained from them its outlines may be redivided for the purposes of triangulation.

Before obtaining the profile or stay of the arch corresponding to one of the oblique lines previously drawn, as X H, it will first be necessary to construct at least a partial section upon the plane which that line represents through the circular wall surface F F^1 of the plan, of which M is the center. As any oblique section of a cylinder is an ellipse, any convenient method of drawing a perfect ellipse may be employed after the major and minor axes of the same have been ascertained. In the present case K M is one-half the minor axis of all the oblique sections. To find one-half the major axis of either of the sections first complete the quarter plan of the cylinder by extending the arc of the wall line till it intersects a horizontal line from M, as shown at L. From L erect a perpendicular, forming the outline of the cylinder in elevation, then extend X H, the line of the desired section, till it cuts the outline of the cylinder, as shown at N. Then X N will be one-half the major axis which is to be used with K M in constructing the elliptical section against which a stay or profile of the arch at H must be developed. The relations existing between the plan, elevation and elliptical section of the cylinder are more clearly shown in Fig. 2, in which the reference letters correspond with those used in Fig. 1. As this operation possesses no features not generally understood this diagram will require no further explanation.

As the only portion of the ellipse required is that against which the back of the stay is to be placed, each portion may also, and perhaps more easily, be obtained in the following manner: First drop a perpendicular from the intersection H of the plane of the section with the soffit or intrados of the arch (the position of the extrados not having been yet determined) to the wall line in plan at H^1. A sufficient portion of this line from H^1 toward L, as to S, may now be divided into spaces, and lines drawn from each of the points so obtained at right angles to the center line K M, cutting the same between K and R. The several spaces thus obtained on the center line may be transferred to any convenient position on a line, X Z, draw from X at right angles to X N, as shown from K^1 to R^1. From the several points assumed between H^1 and S on the circular wall line erect perpendiculars cutting H N, and finally from the points thus obtained on H N project lines parallel to X Z cutting corresponding lines drawn from K^1 R^1 parallel to X N. A line traced through the points of intersection between H^2 and S^1 will give the portion of the ellipse required. This operation is only partially shown in the drawing, and when the elliptical section has been obtained the lines employed in obtaining the same should be erased to avoid confusion with the points and lines of the subsequent operation of obtaining the stay.

Upon the line H^2 S^1 set off from H^2 the several spaces upon the line D E representing the width of the arch mold, beginning with D, as shown from H^2 to T. From the points in H^2 T carry lines, shown dotted in the diagram, at right angles to X N, cutting the same from H to T^1, and from the points on H T^1 drop perpendiculars cutting the wall line in plan, as shown from H^1 to T^2. Lines may now be drawn from the center M through the several points in H^1 T^2 to intersect with the arcs of corresponding number previously drawn in the plan, all as shown between H^1 and T^3, and as described in connection with the profile at F^2 C^1. Lines traced through the several points of intersection will give the true plan of the section or stay to be placed against the line X N of the elevation. It will now be necessary to obtain a correct presentation of the section in the elevation. Since by the original requirements all horizontal lines of the sections are to be drawn radially from M of the plan, it follows that each point of the profile will appear in elevation, not at the point on H T^1 which represents its position on the wall surface, but upon a line drawn horizontally from such point away from the center line. Therefore, from the points in H T^1 draw horizontal lines to the left (from the direction of the center line) and intersect them by vertical lines of corresponding number erected from the intersections previously obtained at H^1 T^3 in the plan. The vertical lines are omitted in the diagram, but the intersections are shown between H and T^1 of the elevation. Having now obtained with accuracy the position of the several points in the profile in plan and elevation, perhaps the most practicable method of obtaining the stay is as follows: Through the points H^1 and T^2 draw a straight line and extend the same to any

convenient distance outside the plan, across which draw at right angles any line, as O P'. From the several points of the section in plan carry lines parallel to H^1 O cutting P O. Now through points H^2 and T of the elliptical section draw a line, which continue to any convenient distance above or below, across which draw at right angles the line P^1 O^1. Upon P^1 O^1 set off from O^1 the several spaces previously obtained on P O, as shown, and from the points thus obtained draw lines indefinitely parallel to O^1 H^2, intersecting the same with lines of corresponding number drawn from H T^4 parallel to H H^2, shown solid in the figure. A line traced through the points of intersection, as shown by H^2 T^5, will give the required profile or stay.

It may be remarked that the profile just developed is not, strictly speaking, a section on the plane X N, because its horizontal lines are drawn, not in the plane of the elliptical section, but radially from the axis of the cylinder—that is, from a perpendicular erected upon M of the plan acting as a directrix of those lines, the other directrix being the elliptical curve H^2 T, shown in plan by H^1 T^2, and in elevation by H T^1. The surface of the stay is therefore really a twisted surface, being, as it were, radial to both curves. The twist is, however, too slight to be considered where practical results only are looked for. Of course, it is possible to construct a perfect section through the arch mold upon any one of the lines radiating from X, or in fact upon any plane that can be shown upon the drawings after an elevation has been completed. Such an operation, though complicated, would be both interesting and instructive. After the sections on the several lines radiating from X have been developed the lines of the elevation may be drawn from the points on E D corresponding to points 1, 2, 6, 7, 8 and 9 of profile A, through corresponding points of the several sections, one of which only (that representing point 1) is shown dotted in the diagram, passing through T^4 and terminating at F^3. A complete front elevation of the arch, showing all the lines of the moldings as they would appear when finished, is not, so far as obtaining the pattern is concerned, necessary, but a correct elevation and plan of the splayed surface representing the blank for the raised mold must, of course, be completed, and this may be accomplished as soon as the line representing the flare has been drawn and its extreme points located upon the several sections.

A suitable flare for the blank is shown by line drawn from *a* to point 9 of the normal profile A. Its length must, of course, be equal to the stretchout of as much of the mold as it is desired to raise in one piece, but so far as the demonstration is concerned may be assumed to be of the length drawn. The point *a* being on the line of the top of the profile extended, its projection may be set off on the center line of the plan, as shown at *a'*, from which point an arc is drawn parallel to the other lines of the plan, as shown dotted in the drawing, forming the outer line of the plan of the blank. To obtain the elevation of the line from *a* of the profile first extend the lines F^1 F^2, T^2 T^3, &c., corresponding to the top lines of the several stays, shown by heavy lines crossing the plan till they cut the dotted line drawn from *a'*, as shown. From these several intersections erect perpendiculars, shown by a dot and dash line, cutting the extended top line of corresponding stays in elevation, as shown at F^5, Q, T^6 and U. The elevation of the outer line of the blank may then be drawn through the points thus obtained, as also shown dotted and outside of the line corresponding to point 1 of profile A. Should the inner point in the profile of the blank fall at any point other than that shown, the position of its line in elevation may be found in a similar manner by first locating it upon the plans of the several sections in plan in accordance with its position on profile A.

The outlines of the blank having thus been obtained in the plan and elevation, a tracing or other accurate duplicate of the same should be made upon another sheet of paper, so that the subsequent operations of triangulation may be conducted as a separate operation and without confusion of lines. The several operations necessary to complete the work from this point are given in Problem 215, to which the reader is referred.

In the working out of any similar problem in actual practice the pattern cutter must use his own judgment in discriminating between that which is scientifically accurate and that which is practical and less laborious. Where the width and projection of the mold are considerable in proportion to the span of the arch correct stays should be developed, but in a comparatively narrow mold the result produced by the raking of the intermediate stays would vary so little from the normal profile that the latter could be easily adapted to the requirements.

The J. M. & L. A. Osborn Company.

J. M. & L. A. Osborn of Cleveland, Ohio, who succeeded the old firm of Myers, Osborn & Co. in 1888, have changed their style to the J. M. & L. A. Osborn Company. The firm were incorporated on July 1 under Ohio laws with a capital stock of $200,000. The corporation assume all the partnership liabilities and will collect all accounts due to the partnership. They carry a large line of all kinds of tinners', roofers', builders' and furnacemen's supplies, together with a full line of enameled iron ware, copper ware, tinware, wooden ware, house furnishings and kitchen specialties. The change is made as the firm about to move to their new quarters, located in the Viaduct, in the building formerly occupied by the Co-operative Stove Company.

The shipping facilities in the new location will excel those of any house in the jobbing line in Cleveland. The building has a frontage of 120 feet on the Viaduct and below of something over 100 feet on the C. C. C. & St. L. R. R. A private switch permits the concern to unload directly into their warehouse, thus enabling them to handle their goods at a minimum of cost. The D. & C. and C. & B. boat docks are just across Merwin street from their building, and all the railroad depots of the city are in close proximity on the Viaduct level.

An immense salesroom will enable the new company to show to advantage their line of goods, and the offices will be so arranged as to make them comfortable and convenient in every way, so that the trade will undoubtedly find it a pleasure to do business with them in their new location. Two large electric elevators will insure quick delivery of all goods to their proper places, and the city trade will have their orders promptly and carefully attended to through a large delivery room on the Viaduct level.

The officers of the new company are James M. Osborn, president, and L. A. Osborn, secretary and treasurer. The company will have their branch warehouse at 39 Vine street, Columbus, Ohio, as before, where can be found at all times their celebrated brands of roofing plates, bright plates, sheet iron, copper and a line of tinners' and roofers' supplies.

Allegheny Steel & Iron Company.

The new sheet mills of the Allegheny Steel & Iron Company, at Tarentum, near Pittsburgh, will soon be completed. Some of the machinery has already been tried out and runs very satisfactorily. The works of this concern consist of a 50-ton basic open hearth furnace, a bar mill of special design, six sheet mills and three cold mills. The six hot mills are driven by a 38 x 60 inch Corliss engine, heavy type, and the bar mill by a 50 x 72 inch Corliss engine, heavy type. The concern will make from 60 to 70 tons of steel sheets per day, and have a very complete plant. Plans are under way for a material enlargement of the works, with a view of taking up the manufacture of other products, galvanized sheets included, but these plans have not been fully developed as yet. The Pittsburgh offices of the concern are in the Park Building.

THE cold rollers at the Humbert works of the American Tin Plate Company, at Connellsville, Pa., have struck for an increase in wages. After the present stock of Black Plate is used up the mill will have to close down unless a settlement of the trouble is made in the meantime.

The Sheet Scale Conference.

The conference of official representatives of the Amalgamated Association of Iron, Steel and Tin Workers and the Uuited States Steel Corporation regarding the scale for sheet mills met at the Hotel Lincoln, Pittsburgh, at 10 o'elock on Thursday moruing. The steel eombination conferees present were: Warner Arms, viee-president of the American Tin Plate Company; Veryl Preston of the Amerieau Steel Hoop Company, William Leeds of the American Sheet Steel Compauy, J. V. Jenks of the American Steel Hoop Company, and Charles W. B. Ray, chief engineer of the American Tin Plate Company. The workers' organization was represented by the Geueral Executive Committee, the highest body in the assoeiation, the members of whieh include President T. J. Shaffer, Secretary aud Treasurer John Williams, Assistant Secretary M. T. Tighe, Business Manager Benjamin I. Davis, and the trustees and viee-presidents of the association.

The object of the confereuee was the settlement of the strike ordered by the Amalgamated Assoeiation in the uniou mills of the American Sheet Steel Company and the American Steel Hoop Company. In additiou to the settlement of this question the eonference was admittedly undertaken to avert a possible general strike in all the mills controlled by the United States Steel Corporation. The union mills of the two eoustituent companies named have beeu closed down sinee June 29, beeause of the refusal of the Steel Corporation to sign the Amalgamated scale for their nonunion plants. Two sessions of the conference were held ou Thursday, the first from 10 a.m. until noon and the second from 2 to 5 p.m. As no settlement was arrived at at these sessious the eouferenee adjourned to meet at 10 o'cloek on Friday morning.

At the afternoon session President Shaffer, in behalf of the Amalgamated Assoeiation, formally presented the case of the organized workmen and strikers. He laid stress upon the faet that until this year the union had made no effort directly to force all the plants of the combine into union lines, for the reason that it was thought better to have that movement originate and be earried on amoug the workmeu in the nonuuiou mills themselves. Since last year, however, a uew eondition eonfronted the union men. The officials of the various eompanies, he claimed, had plainly indicated their policy to operate their nonunion plants in preferenee to the union, only working the latter when it was found absolutely neeessary. This plan, Mr. Shaffer declared, was foreing men to desert the organization in order to get work. It was a matter of life or death for the Amalgamated Association that the nonunion mills be done away with, as Mr. Shaffer put the situation. The alleged method as adopted by the American Sheet Steel Company in the case of the Old Meadow mills at Scottdale, Pa., was especially dwelt upon, and the demand made by the eompauy that the mill in question be left out of the seale entirely in the future was taken as an indieation of the general plan of the company in dealing with the Amalgamated Association. It meant, said Mr. Shaffer, the giving up of all rights of the unions at the plants of the Uuited States Steel Corporation.

In reply to the statement of President Shaffer the officials of the various companies gave an outline of their position, saying that they have no intention of working any injustice toward union workmen in their mills. The feeling for the Amalgamated men, they stated, had always been friendly, and they have no desire to force any trouble in regard to the association.

The tone of the debate on either side is described as having been amicable, and it was apparent that the manufacturers' representatives were prepared to go a considerable length to gain a peaceful solution of the existing difficulties. The impression is that the present conference will come to some sort of an agreement, as both sides will be the gainers by an avoidance of a general strike at this time.

It is intimated that concessions will be allowed the manufacturers in the mills that have agreements with their men made previous to last year's wage settlement. These mills, it is said, will be allowed to work out their annual agreemeuts, whieh expire on January 1 next, but after that time it is intended by the Amalgamated Association that these mills also shall eome under the jurisdiction, or sooner, if the men beeome members of the association previous to the expiration of the annual agreement. The sheet mills at Vandergrift and Leechburg, so far as known, are the only ones where agreements with the workmen antedate the formation of the Amerieau Sheet Steel Company and remained in foree when the plants were absorbed.

There is no doubt that the Amalgamated Association has ehosen a very opportune time to enforce its demand for reeognition of the seale iu nonunion mills. The demand for sheets is remarkably heavy, priees are very profitable, and it is entirely to the interest of the United States Steel Corporatiou to keep the mills steadily employed. It is understood, too, that pressure from high offieials of the United States Steel Corporatiou, and also from banking interests represented by J. P. Morgan & Co., has been brought to bear upon the offieials of the constituent eompanies, with the objeet of indueing a prompt settlement of the present trouble.

The conference was resumed on Friday and is still iu sessiou as we go to press.

TIN HOUSE SCALE SIGNED.

It has been offieially announeed that the tin house scale has been settled by the Internatioual Tin Plate Workers' Protective Association with the Amerieau Tin Plate Company. Advances in wages were granted ranging from 3 to 10 per eent. The Amalgamated Association scale, which was signed last month, went into effect on July 1. The seale of the tin house employees becomes effeetive on July 15.

Seamless Tubing.

We have received a eatalogue from the Benediet & Burnham Mfg. Company of Waterbury, Conn., deseribing their Benediet niekel seamless tubing and its properties. This tubing is produced by a pateuted hot rolling proeess of which this company are the sole lieensees in the United States. By this process a single operation transforms a solid eylindrical billet of the heated metal into a tube, the action of the rolls inereasing the firm and solid structure of the metal and produeing an exeeedingly tough aud strong tube. The billet is revolved between conical rollers, whieh force it ou the forming mandrel, giving a spiral formation to the metal eomposing the walls of the tube, and thereby greatly inereasing its tensile strength. A parallel to this tubing is found iu a twist gun barrel, the fibers of which are arranged spirally to its axis, rendering it eapable of resisting great bursting strain. After the hot rolling proeess has thus formed the tubes they are then cold drawn suffieiently to give a perfeetly smooth finish both inside and outside.

The absorption of the National Steel Company and the Amerlean Steel Hoop Company into the Carnegie Steel Company was eonsummated last week at a meeting of the directors of the eoneerns named in New York City. All of the offieials and clerks of the National Steel Company and the American Steel Hoop Company have left New York and are now quartered in the Carnegie Building in Pittsburgh, where in future the general offiees of these corporations will be located. At first it was intended that the names of these two eoneerns should be dropped and all business carried on under the name of the Carnegie Steel Company. This, however, was changed, and the two concerns will eontinue to trade under the names of the National Steel Company and the American Steel & Hoop Company, as before.

E. L. Parker & Co., Baltimore, Md., are distributing a blotter in the interests of Parker's Double Dipped Old Method Superior Charcoal Roofing Plate. This Plate is described as made from specially prepared, hammered blooms, and is redipped and double dipped on a porous base, the dipping being done by the old hand proeess, thus securing the greatest amount of coating with an even finish. The Plate is elaimed to have five times the amount of coating used on ordinary Charcoal Ternes and to be exceedingly soft and thoroughly pliable.

THE LETTER BOX.

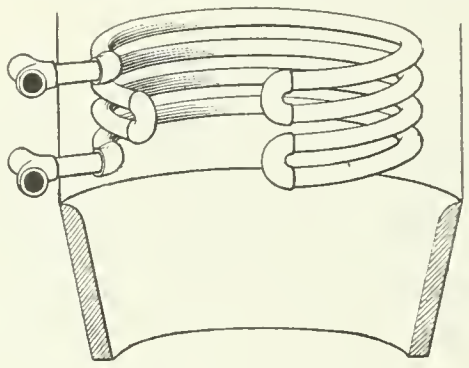
Inquiries in regard to practicat questions of general interest are invited, in reply to which we shatl be glad to receive suggestions and information from our readers.

Correspondents are requested in atl cases to give their names and addresses, which wilt not, however, be pubtished or disclosed without their consent.

HEATING FROM COIL IN FURNACE.

From C. A. T., Brantford, Canada.—We propose to place a coil of 2-inch pipe over the fire in a hot air furnace having a 28-inch fire pot, for the purpose of heating six radiators exposing a total of 275 feet of radiation. We would like to know how many feet of 2-inch pipe should be included in the coil to do the work satisfactorily? As a 2-inch main is hardly large enough to supply the amount of radiation, would it be of any advantage to increase the size of the mains outside of the furnace, by placing a two-branch header on the ends of the coil for the flow and return connections, or, perhaps, a double elbow, as per the sketch?

Note.—Benefit would be derived from increasing the size of the flow and return mains at a point where they connect with the heating coil, either by use of the fittings suggested, or by a pipe of larger diameter if a single flow and return main is used. The amount of surface which the heating coil must expose depends somewhat on the way the furnace is run. A very important feature of combination heating work will have been mastered if, in designing such a plant, the warming to be done with hot



Heating from Coil in Furnace.

air are so divided that the water will not be overheated in order to raise the air to a temperature to do effective work, or, on the other hand, the water is kept at a temperature high enough to accomplish its work when the air is sufficiently heated to keep the air warmed portion of the building comfortable in both mild and severe weather. Assuming that this part of the work has been correctly divided up, the manner in which the fire must be run to heat the building can be readily anticipated.

If the furnace is of ample capacity so that the fire would be run mildly, 1 square foot of heating surface in the coil will carry less radiation than if the furnace is to be fired hard to do the work. Some benefit is derived by having at least one turn of the coil run around the fire pot so that it will come directly in contact with the fire. This will increase the heating power of the surface exposed. It is not uncommon to estimate that 1 square foot of heating surface in the fire in a furnace will carry 30 square feet of radiation, and as the coil must carry the flow and return pipes as well, ordinarily the surface they expose will be about 25 per cent. of the surface exposed in the radiators. Consequently, in this instance, the coil would have to carry about 345 feet of heating surface. By dividing this amount by 30 square feet it will be found that about 11 square feet of surface would be required in the coil, and by multiplying this by 1.6, the number of lineal feet required to expose 1 square foot of surface in a 2-inch pipe, it will be found that the coil will require 17½ lineal feet to present the desired surface. If it is estimated that the fire will be run so that 1 square foot of surface will carry 40 feet of radiation, by dividing the 345 by 40 and multiplying the result by 1.6 it will be seen that only 13¾ feet of 2-inch pipe will be necessary. This, however, is a point which our correspondent must decide for himself.

SANITARY HEATING.

From R. R. M. Carpenter, Wilkes-Barre, Pa.—In reply to the inquiry of "W. I. E." in *The Metal Worker* of June 22, I would say, in comparing the hot air system of heating and ventilation with a direct-indirect steam system, that the former is the more sanitary. In some cities a law has been passed forbidding the heating of schools with direct steam. To pass such a law as this, sufficient proof must have been found to pronounce direct steam unsanitary. Now it is plain to see that the simple converting of direct steam into direct-indirect—that is, simply cutting a hole in the walls behind the radiators to admit fresh air, and this only when the wind happens to be in the right direction, cannot be deemed as sanitary as the admission of large quantities of fresh air from all sides of the building, collected into a fresh air room, and from there passed through the furnace chamber and so on up sufficiently large flues to regulate the flow.

The cost of a perfect steam system may be figured as follows: Take a standard school room of 50 pupils. To heat it in compliance with the Massachusetts law, which requires that each pupil must receive a quota of 30 cubic feet of air per minute, which is equivalent to 1800 cubic feet of air per hour for one pupil, or 90,000 cubic feet for 50 pupils, and adding 10,000 cubic feet for safety, there would be an admission of 100,000 cubic feet of air per hour into the room. One cubic foot of air can be raised 1 degree by .02056 heat unit; therefore 100,000 cubic feet of air may be raised 1 degree by 2056 heat units, or it may be raised to 100 degrees, the temperature at which the air should pass the registers, by the use of 205,600 heat units. To evaporate 1 pound of water into steam at atmospheric pressure, 966.1 heat units would be required. Now if we have 205,600 heat units, we shall require as many pounds of water as 966.1 is contained in 205.600 heat units, or 212.8 pounds of water, to be evaporated in the boiler per hour. W. J. Baldwin says that each pound of coal will evaporate 10 pounds of water per hour; so the amount of coal used per hour would be one-tenth of 212.8, or about 21.3 pounds of coal. Say the boiler is fired 11 hours a day for five days a week and five hours on Saturday and Sunday, we will have 65 hours a week the boiler is fired. Or, counting 27 weeks a year in which the boiler is fired, the boiler will be fired 1755 hours per school year. The coal, then, burned in a school year would be 37,482 pounds, or, roughly, 19 tons, which, at $2.50 per ton, amounts to $47.50 per year. The price I give is that of four years ago and compares with the actual cost of furnace systems at that time. I have on record in my desk a school building in Kingston, Pa., which was heated by the Carpenter system of hot air heating for just $13.60 per room, giving precisely the same quantity of air as that specified in the above steam system.

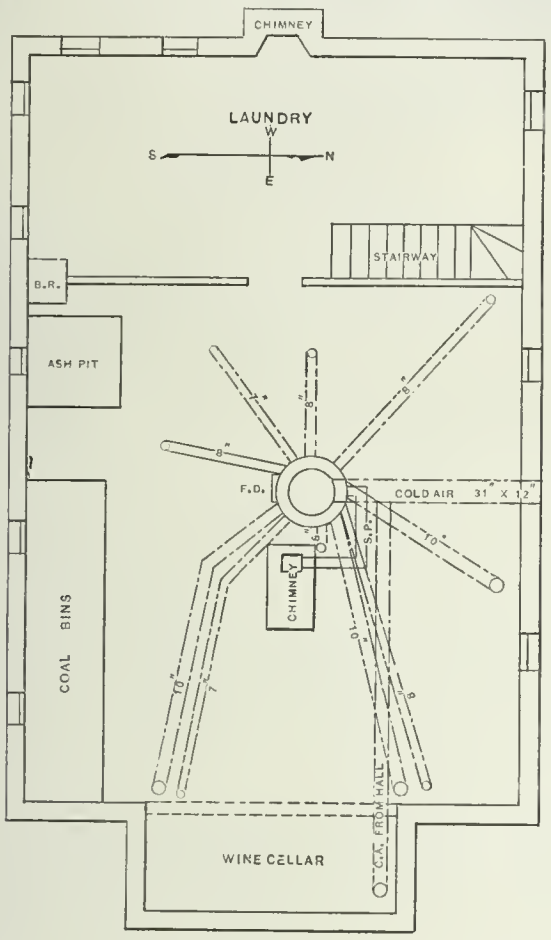
CLEANING ZINC.

From W. B., Bridgeport, Conn.—Will *The Metal Worker* or some of its readers kindly give a method for cleaning zinc, such as is used under stoves and for sink lining? In almost every house where I work I am asked what is the best way to clean zinc? I have advised the use of kerosene, sapolio, &c., but am met with the complaint that the zinc cannot be properly cleaned with these materials.

Answer.—A well-known receipt book says that zinc is generally mechanically cleaned by scouring with sand and powdered pumice. The bath used for brass is also very effectual. This is composed of 1 part ordinary nitric acid and 1 part sulphuric acid, and must be washed off with clean water. For large articles which cannot be dipped in the bath of acid and water, apply a solution of potassium, ammonium and tartrate, thickening with sufficient clay to make a fluid paste. After a few hours rub the article with a brush dipped occasionally in fine sand, moistening with the pickle, then polish with powdered charcoal or Vienna lime. After the zinc has been cleaned a good way to continue its bright appearance is to give it an even coat of some substantial transparent varnish.

SMALL FLUES HINDER HEATING.

From J. T. B., Putnam, Conn.—A customer here had a portable furnace having a 48-inch casing with a 28-inch



Small Flues Hinder Heating.—Fig. 1.—Cellar Plan, Showing Proposed Piping System.

fire pot put in his house last fall, and it has never given entire satisfaction. I am now called upon to reset the

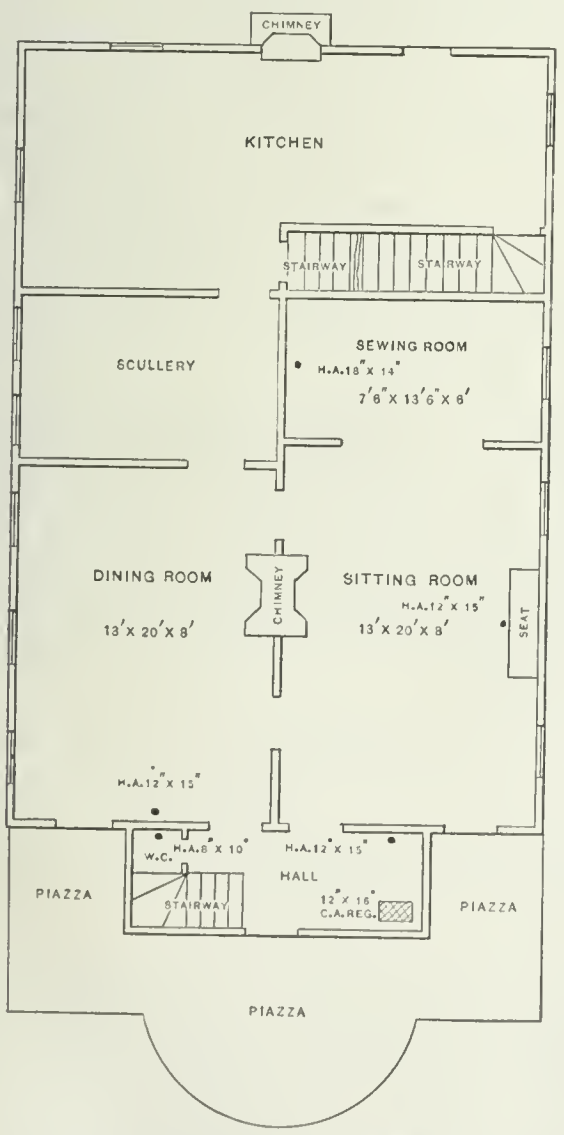


Fig. 2.—First-Floor Plan.

furnace and to guarantee it to heat the house to a temperature of 70 degrees in zero weather. The house is a well built frame construction exposed on all sides. I submit in Fig. 1 a plan of the cellar showing the arrangement which I propose to use. Figs. 2 and 3 are plans of the first and second floors and show by dots the location and give the size of the registers, which are all placed in the side walls. I shall use the same size of hot air pipes as have been used heretofore, for I do not think the trouble has been in them. The furnace was originally set without a cold air pit under it, and the cold air entered at the back of the furnace on the level of the cellar bottom. It was originally set 9 feet northeast of the position in which I intend placing it, with the door facing west and the cold air coming in from a northeast window. The cold air duct had four bends in it. I propose to arrange a cold air duct as shown and increase its size from 31 x 9 inches to 31 x 12 inches, and in addition I shall take a 10-inch return pipe from a cold air register to be placed in the hall. The area of the hot air pipes will be 560 inches, while the combined area of the new cold air duct and the 10-inch return pipe will be 450 inches. It is claimed by the makers that this fur-

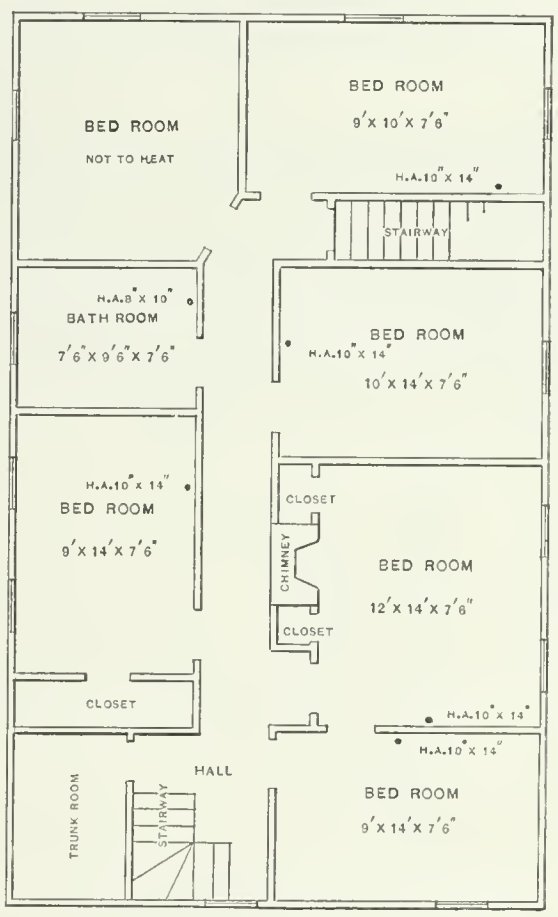

Fig. 3.—Second-Floor Plan.

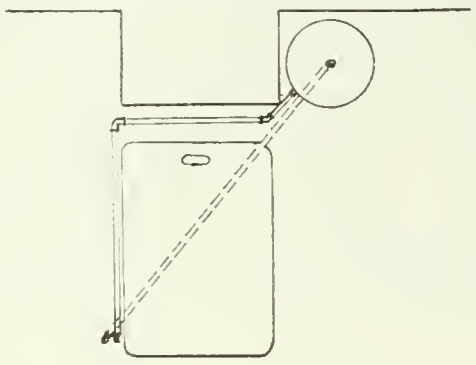
nace has capacity for heating from 10 to 15 rooms, and it will be seen that in this house it is called upon to heat but 9 rooms and hall, as the 10-inch pipe leading to the hall also leads to the northeast bedroom and heats it as well. The furnace is connected with a 9 x 12 chimney. I should like to know whether my proposed plan will be successful in heating the building.

COATING FOR GALVANIZED TANK.

From A. L. B., Eustis, Fla.—I need some information and take the liberty of inquiring for it from *The Metal Worker* and its readers. There is a square wooden tank built in the top of a house here and lined with No. 26 galvanized iron, which supplies water for cooking, bathroom, &c. The water is pumped from a well to the tank and is very pure and almost as soft as rain water. The tank has been in use for eight years, but this summer it is pitted with small holes, apparently from rust. I have put a new lining of better quality galvanized iron into the tank. The question I desire to have answered is this: Is there any kind of paint that I can put on the iron to prevent it from rusting again? I have found it difficult to make any kind of paint stay on this kind of iron, even in the air, let alone under water.

CONNECTING A BOILER UNDER DIFFICULTIES.

From Oliver Twist.—We have had occasion many times to connect boilers under the same conditions as shown in the sketch of "J. O.," in *The Metal Worker* of June 15, and can guarantee him success if he connects the boiler as shown in the accompanying sketches. The plan given in Fig. 1 shows the upper pipe from the water front run along under the top edge of the stove, while



Connecting a Boiler Under Difficulties.—Fig. 1.—Plan, Showing Piping.

the lower pipe is dropped through the floor, goes direct to the boiler under the cellar joists, and is provided with a blow off valve, as shown.

The side elevation, given in Fig. 2, shows the upper pipe from the water front connected at the top of the boiler, while Fig. 1 shows it entering the side with a 45-degree elbow. It will work satisfactorily either way. If it is not desirable to carry the pipe beneath the floor it may be taken across to the boiler just beneath the oven door. It may be noticed that the bottom of the boiler is

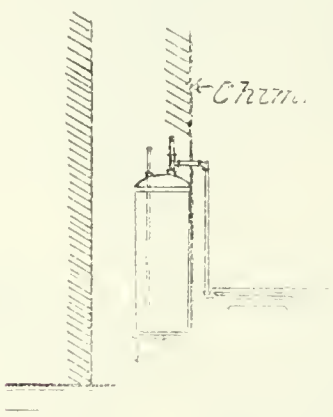


Fig. 2.—Elevation, Showing Piping.

too low to allow of a continuous fall from the boiler to the water front for both pipes, even if it was desired. But without discussing this, we will simply say that many stoves and ranges are connected as shown and work without any trouble—no noise and plenty of hot water.

WATER CLOSET CONSTRUCTION.

From W. S., Blue Island, Ill.—Please explain the difference between the siphon jet closet and the siphon washdown closet.

Answer.—A siphon jet closet is one in which the discharge from the closet bowl into the waste pipe is partially induced by means of a portion of the flushed water entering the discharge passage of the closet at the bottom of the water seal and being directed toward the waste pipe. The object is to induce an overflow into the weir formed by the shape of the outlet in the closet, which makes a practically right angled turn before it reaches the soil pipe connection. The weir retards the flow of the water slightly, so as to fill the full bore of the pipe and prevent air rushing up. The result is a downward movement of water in the stack, having exactly the same effect as that produced in the long leg of the siphon. This enables the atmospheric pressure to exert its force on the surface of the water in the closet bowl, and the contents of the closet are discharged.

In the washdown siphon closet there is no right angled turn acting as a weir to secure the siphonic action. Some washdown closets, however, are induced to discharge by means of a jet. The washdown siphon is really the best form of a hopper and trap combined closely connected. In operation the overflow is sufficiently quick and in large enough volume to set up a siphonic action and exhaust the contents of the bowl.

TRADE NOTES.

The Joseph Dixon Crucible Company, Jersey City, N. J., are sending out a postal card in the interest of Dixon's Silica Graphite Paint, on which it is pointed out that this Paint is manufactured of only one quality and of the purest materials obtainable. The company have gotten out a pamphlet entitled "Economics of Protective Paint," which they are willing to send to any one interested, upon application.

The Garvin Machine Company, Spring and Varick streets, New York, are distributing a folder giving a list of the second hand Machinery which they are carrying in stock, including a large number of Sheet Metal Working and other Machine Tools of various kinds.

The Superior Mfg. Company of Allegheny, Pa., have been chartered with a capital of $25,000 for the manufacture of Sheet Metal Gas Burners for domestic and manufacturing purposes. W. T. Bradberry, William H. Collingwood, T. M. Dudgeon and Robert A. Bradford are the incorporators.

John Wesley Harris, formerly a member of the firm of Harris Brothers, Gas Meter manufacturers of Philadelphia, died on July 6 at Landsdowne, Pa., aged 78 years. He was born at Liberty Grove, Md., and for a number of years was occupied in the Stove manufacturing business.

The Star Antimony Company of Mena, Ark., with a capital of $500,000, were recently chartered to mine Antimony near that town. T. S. Mahoney is president of the concern and L. Underwood secretary.

At a meeting of the stockholders of the Carborundum Company of Niagara Falls Vice-President F. W. Haskell was promoted to the presidency of the company. In taking this office Mr. Haskell succeeds E. G. Acheson, who is the discoverer of the process by which Carborundum is made. For some little time Mr. Haskell has been the chief executive officer of the company. Mr. Acheson remains with the company as consulting engineer, but will give much of his time to his artificial graphite interests. Secretary Rayner and Treasurer Manley were re-elected to the same offices by the stockholders of the Carborundum Company.

The Bryan Vacuum Molding Machine Company of Lockport, N. Y., have been organized to manufacture and sell the Bryan Molding Machine and the foundry accessories necessary to be used in connection with it. It is a pattern drawing machine and is capable of use with the ordinary wood patterns. It is not proposed to build a plant at present. The machine will be on the market within the next two weeks. The Eastern representatives are the Power Specialty Company of 126 Liberty street, New York, where one of the machines may be inspected.

The Union Mfg. & Specialty Company, recently incorporated, will this week take over the business heretofore known as the Union Mfg. Company. The new company will continue the manufacture of foot power Grinding Machines and Lathes, and Hardwood Specialties, at 506 and 508 Genesee street, Buffalo, N. Y., and will be under the same management.

United States Consul Winter of Annaberg, Germany, says it is claimed that the Lucas light, manufactured by the Deutsche Beleuchtungs und Heiz-Industrie Actien-Gesellschaft, Berlin, can successfully compete with electricity as an artificial light. The apparatus, adds the Consul, is simple, can be attached to the ordinary gas pipe, and may be readily lighted by pulling a wire. The intensity of the light is equal to 500 candle-power. One important feature claimed for it is cheapness, in comparison with electricity.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is ½c. lower; business quiet.

Copper is quiet and firm.

Pig Lead remains firm and unchanged.

Spelter is dull and without change.

Antimony is quiet; no change in prices.

Nickel is still scarce and firm.

Aluminum is active at former prices.

Tin Plates are in steady demand and prices strong.

Sheets continue in very active demand; recent reduction in price has not affected local quotations.

Old Metals are quiet and rather weak.

Pig Iron is quiet, but shows more strength.

Sheet Copper is in good demand and firm in price.

Sheet Zinc is unchanged.

Hardware is moving in good volume for the season and the tone of the market is strong.

Plumbers' Supplies are very firm in price, with satisfactory volume of business.

Wrought Iron Pipe is scarce; jobbers have advanced prices 5 per cent.

Cast Iron Pipe and Fittings are moving actively and prices are strong, with upward tendency.

Steel Clad Bathtub quotations have been advanced 10 per cent.

Lead Pipe and Sheet Lead are firm and higher.

Pumps have been advanced 10 per cent.

Shot was advanced this week.

Wire Nails are in fair demand and without change.

Cut Nails are irregular in price and in moderate demand.

Wire continues very active and firm.

White Lead is firm.

Linseed Oil has scored another rise of 5c. per gallon.

Spirits Turpentine is ½c. a gallon higher.

METAL MARKET.

Office of *The Metal Worker*, 232-238 William street, New York. July 12, 1901.

Pig Tin.—During the closing down of the New York Metal Exchange from July 4 to 8 a heavy advance in spot Tin occurred in London. At the opening of the market here on Monday it was found that London prices had soared many points in the interval. This advance was followed up on Tuesday, when the rise culminated in the price of £140 for spot Tin. The cause to which this rise is attributed is that the stock of Tin in London was cornered by one party, who was able to dictate spot prices. On Wednesday a sharp break occurred, however, followed by a temporary upward reaction, and again by a break on Thursday. The market at the close had recovered somewhat, but showed, as the result of the fluctuations, a decline of about ½c. from the figures ruling a week ago. Straits Pig in small lots is quoted at 28¾c. to 29¼c. per lb. Business here was of small proportions, consumers not being inclined to buy beyond the limit of their actual needs.

Copper.—The market here was quiet to the point of flatness, transactions being light, and prices firm at the level ruling for some weeks past. Small lots of Lake Ingot are quoted at 17¼c. to 17½c. per lb., and Casting Copper at 16¾c. to 17c.

Sheet Copper.—The demand for Sheet Copper keeps up in good volume. It is apparent that a large consumption of this material is going on. The demand from the Cornice trade is described as brisk, much Sheet Copper being used in the construction of the many large new buildings now going up in various parts of the country. Prices are firm and unchanged on the basis of 21c. per lb. for moderate sized lots of Sheet Copper from store.

Pig Lead.—The market is entirely without new feature, the demand being of moderate proportions and prices unchanged and steady. Small lots of American Pig are quoted at 4.60c. to 4.62½c. per lb.

Spelter.—Spelter remains very dull and prices weak, although quotably unchanged. Good Western brands in small lots are quoted at 4.45c. to 4.50c. per lb.

Sheet Zinc.—Jobbers report a fair seasonable demand for Sheet Zinc, without any features of special interest. Prices are without change, 600-lb. cask lots being quoted at 6¾c. per lb., and smaller quantities at 7¼c.

Antimony.—There is no change in this metal. The demand is somewhat slow and prices remain as given in our last report. Cookson's in small parcels rules at 10½c. to 11c. per lb., and Hallett's 8¾c. to 9½c.

Nickel—Is firm and without change. The metal is still quite scarce, and in small lots is quoted nominally at 60c. to 65c. per lb.

Aluminum.—An active demand for Aluminum continues at former prices—viz., 37c. per lb. for small lots of No. 1 Ingot guaranteed 99 per cent. pure, and 35c. for 100-lb. lots.

Tin Plates.—There is nothing new to be noted in this market. Deliveries continue on a liberal scale and new business is of fairly large proportions. Consumers, however, do not seem to be placing many large orders for future deliveries. The signing of the Tin Plate wage scales for the year ending June 30, 1902, is a satisfaction to the trade, as removing the risk of a prolonged shut down of the mills during the summer, with a possible attendant scarcity in the supply of Plates. The retail demand is of satisfactory volume and covers all varieties of Coke and Charcoal Bright Plates. Roofing Ternes are not as active as Bright Plates, although the movement in these goods is of fair proportions. Prices are firm and unchanged, jobbers quoting American Bessemer Coke Plates, I C, 14 x 20, at about $4.85 to $4.90 per box, and I X at $5.95 to $6 for moderate quantities delivered at New York or corresponding points. A slight decline in the Welsh market was reported this week.

Sheets.—The trade are still discussing the recent reduction in the prices of Black and Galvanized Sheets made by the American Sheet Steel Company, and the impression is very prevalent that the real reason for this cut was to discourage importations, as no other valid cause can be discovered for the action of the company at the present time. The reduction does not seem to have been followed by the independent mills, who are holding to their former prices, and it has not in any way affected retail prices in this section. Meanwhile, the scarcity of Sheets is becoming more emphasized each week. Jobbers are hard put to it to meet the requirements of their customers, and consumers who are obliged to have stock for immediate use are glad to pay a handsome premium on quoted rates in order to secure their supplies. Deliveries of both Black and Galvanized Sheets inside of two or three months are almost impossible to get. Most of the mills are entirely sold up for the third quarter of the year, and some have a large part of their tonnage booked for the fourth quarter. Jobbers are quoting No. 27 Black, One Pass Cold Rolled Soft Steel Sheets, at 3.65c. to 3.70c., and Galvanized Sheets at 62½ and 5 per cent. to 65 per cent. off the list.

Chicago advices are as follows: The Sheet situation is peculiar. Notwithstanding the reduction in prices made by the leading Sheet company the market here is actually stronger. Large buyers assert that it is impossible for them to purchase Sheets at the reduction announced. The independent mills are maintaining the old prices and will not accept business at the reduced figure. Jobbers are actually advancing prices from stock, instead of reducing them, because of the heavy drafts now being made on them. They claim that it

would be unwise to reduce prices in view of the difficulty in replacing what they sell. No. 27 Black Sheets are firm at 3.40c. to 3.50c. from store, and Galvanized at 65 and 10 to 70 off. Some of the largest jobbers are selling Galvanized Sheets at 65 and 10 in carload lots.

Old Metals.—Trade is quiet and prices are without quotable change. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 15 c.
Light and Tinned Copper	per lb. 13½c.
Heavy Brass	per lb. 10 c.
Light Brass	per lb. 8 c.
Lead	per lb. 4 c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 18½c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	$6.00
Wrought Iron Scrap, per gross ton	$10.50 to 11.00
Heavy Cast Scrap, per gross ton	10.00 to 10.50
Stove Plate Scrap, per gross ton	7.00 to 7.50
Burnt Iron, per gross ton	5.00 to 5.50

THE PIG IRON MARKET.

NEW YORK.—The only purchases of any consequence made during the week were those of the Eastern Malleable interests, who took about 5000 tons of Coke Iron. Local founders are buying from hand to mouth, some of them at very frequent intervals. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, $16 to $17.50; No. 2 X, $14.75 to $15.75; No. 2 Plain, $14 to $14.50; Tennessee and Alabama brands, No. 1 Foundry, $14.75 to $15; No. 2 Foundry, $14 to $14.50; No. 1 Soft, $14.50 to $15; No. 2 Soft, $14 to $14.50; No. 3 Foundry, $13.25 to $13.50; No. 4 Foundry, $12.75 to $13.25.

CHICAGO.—A great deal of figuring is going on, but the actual volume of business has not been large. Many consumers of Foundry Iron will be obliged to purchase good quantities to cover their wants the last half of the year; but, meanwhile, they are deterred from closing contracts by the danger of a molders' strike. As soon as this question is settled the Pig Iron market is expected to be active. The situation is strong among the local furnace companies. Their product has been cut down by the hot weather, and their yards are still completely bare of stock. The Southern furnace companies are adhering closely to recent quotations, although it is possible that the figures given below may be shaded 25c. per ton on Foundry Iron. We quote as follows:

Lake Superior Charcoal	$17.00 to $18.00
Local Coke Foundry, No. 1	15.50 to 16.00
Local Coke Foundry, No. 2	15.00 to 15.50
Local Coke Foundry, No. 3	14.50 to 15.00
Local Scotch, No. 1	15.75 to 16.25
Ohio Strong Softeners, No. 1	16.00 to 16.50
Southern Silvery, according to Silicon.	14.90 to 15.15
Southern Coke, No. 1	14.65 to 14.90
Southern Coke, No. 2	14.15 to 14.40
Southern Coke, No. 3	13.65 to 13.90
Southern Coke, No. 1 Soft	14.65 to 14.90
Southern Coke, No. 2 Soft	14.15 to 14.40

PHILADELPHIA.—The feeling in regard to Pig Iron is more confident, and prices for all grades are firmer. Inquiries have been more numerous and a number of small lots have been sold. Consumers do not appear to be quite ready to take hold on large lots, but with stocks at a low point it is quite probable that some large sales will be made during the next few weeks. Some good sized inquiries are already in the market and others are said to be practically closed. The range of prices for Philadelphia and nearby places may be given as follows: No. 1 X Foundry, $16 to $16.25; No. 2 X Foundry, $15 to $15.50; No. 2 Plain, $14.50 to $14.75.

PITTSBURGH.—Two large corporations have bought Bessemer Pig Iron for July and August shipment, but beyond this very little has been done. Foundry Irons are quiet, and No. 2 is sold as low as $14, Pittsburgh. We quote Standard Bessemer at $13.75 to $14; No. 1 Foundry at $14.50 to $15; No. 2, $14 to $14.50, and No. 3, $13.75 to $14, all f.o.b. Pittsburgh.

CINCINNATI.—In Pig Iron circles the situation is still rather dull. There has been some Pipe and Foundry Iron selling round through the Central West in lots up to 2000 tons. The run of small orders has also been better. Prices so far as Southern Iron goes are simply wretched from the standpoint of many furnaces. While there have been no cuts made, so far as reported, on the minimum figures given here on lower grades, yet it is undoubtedly true that No. 2 Southern has been sold down to $10, Birmingham. There is much talk in effect that the decline in prices of the past two months was a senseless proceeding. Consequently a stronger feeling is developing, and it is believed the bottom of the fall has about been reached. Northern Irons are relatively much stronger than Southern, and but little disposition is shown to shade figures to meet Southern competition. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$13.50 to $13.75
Southern Coke, No. 2	13.00 to 13.25
Southern Coke, No. 3	12.25 to 12.75
Southern Coke, No. 4	11.75 to 12.00
Southern Coke, No. 1 Soft	13.50 to 13.75
Southern Coke, No. 2 Soft	13.00 to 13.25
Southern Coke, Gray Forge	11.75 to 12.00
Southern Coke, Mottled	11.75 to 12.00
Ohio Silvery, No. 1	15.50 to 16.00
Ohio Silvery, No. 2	14.50 to 15.00
Lake Superior Coke, No. 1	14.50 to 15.00
Lake Superior Coke, No. 2	14.00 to 14.50
Lake Superior Coke, No. 3	13.50 to 14.00

CHICAGO REPORT.

Scrap Iron & Steel.—Business has been quiet for some time, but as the mills are again running a better demand is expected soon. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap	$10.50 to $11.00
Machinery Cast	10.00 to ....
Malleable Cast	10.00 to 11.00
Stove Plate (free from burnt)	7.00 to 7.50
Burnt Iron and Grate Bars	5.50 to 6.00
Sheet Iron and Hoops	6.00 to 7.00
Plow Steel	9.00 to 10.00
Breaking Stock	9.00 to 9.50
No. 2, such as Shovels, Hoes, &c.	.... to 7.00
Old Boilers—whole (Iron)	.... to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	9.50 to 10.00
Old Gas Pipe and Boiler Tubes	9.50 to 10.00
Cast Borings	.... to 3.75
Turnings	8.00 to 8.50
Horseshoes	11.00 to ....

Old Metals.—The demand is light and will continue so until labor troubles are settled. Dealers quote buying prices on small lots as follows:

	Per. lb.
Copper Wire and Heavy	15 c.
Copper Bottoms	13½c.
Copper Clips	14½c.
Red Brass	13½ to 13¾c.
Yellow Brass	10 c.
Red Brass Borings	11½c.
Yellow Brass Borings	9 c.
Light Brass	7¾c.
Pipe Lead	4 c.
Tea Lead	3½c.
Zinc	2¾c.
Pewter, No. 1	19 c.
Pewter, No. 2	10 c.

Old Rubber.—Nothing is doing in this line, dealers waiting for conditions to improve. Buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$20.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7 2-3c.
Rubber Car Springs	....	4¾c.
Inside Bicycle Tubing	....	21 c.
Outside Tubing	....	7¼c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—The first week of the month, as usual, has been quiet. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.25	6.50
Kansas City, Mo	8.25	8.50

A discount of 20c. from these figures is allowed on all Coal ordered to be shipped in July.

In the first six months of 1901 the Maine shipyards turned out about 28,000 tons, gross, of new vessels, indicating that the total output for the year will exceed that of 1900. Bath yards alone have now in hand steel and wooden vessels aggregating nearly 20,000 tons.

THE HARDWARE TRADE.

At this season many influences tend to reduce the volume of business. Travelers are nearly all at home and there is thus a cessation in the active pursuit of orders. Principals and employees are enjoyiug or looking forward to vacations. With the lessened demand for goods there ls with both manufacturing and mercantile establishments more or less attention given to the review of the course of thlngs during the half year just passed and the closing up of its business. Preparatlons are also making for the prosecution of trade in the opening season. This calls for new plans and enterprises, the consideration of whlch reeeives a good share of the attention of progressive manufacturors and merchants. Faetories also are being shut down and overhauled and in some eases enlarged to meet the demands of the trade wlth inereased faeilities. The eondition of the market, too, encourages a waiting policy, so that while there is a good deal of buylng going on, it is not, as a rule, in espeeially large quantities. While these influences operate against a heavy volume of business, it is gratifying to note that there continues to be a good demand, and the general situation is eminently satisfactory. The promise of the erops is on the whole excellent, and there thus appears to be a basls for general prosperity. Notwithstanding setbacks in certain directions and in certain lines of goods, it is evident that the general export business of the eountry is larger than ever before, and that in this trade Hardware and metal products are holding an important place. Industrial and manufacturing enterprises continue to be actively prosecuted and there is more building than for several years. The state of the market is such that the trade ln most lines feel safe in placing orders for their requirements for the near future, but there is practically no disposition to speculate and a conservative policy is generally regarded as prudent.

NOTES ON PRICES.

Plumbers' Supplies.—Local jobbing houses report that the demand for Plumbers' Supplies still keeps up in quite good volume for the season of the year. The month of June with some of the leading concerns in thls line showed a favorable comparison with any previous month of the year, notwithstanding the great heat whieh prevailed throughout this section, and so far, July has kept up the record. This activity, however, is not attributable to any marked increase in the volume of city business, whieh is still below expectations. The larger demand comes almost wholly from the out of town trade, who seem to be more active than for many seasons past at this time of year. Prices remain firm, without indications of weakening in any quarter, owing to the actual demand for goods and the strength of raw materials. Further advances are expected in some lines of goods. The scarcity of supplies is still marked in connection with Cast and Wrought Iron Pipe, Enameled Sanitary Ware, Plumbers' Brass Goods, and Earthen Ware. Jobbers are finding great difficulty in meeting the wants of their customers in these lines.

Wrought Iron Pipe.—The Wrought Iron Pipe situation is about to undergo a radical change. It seems that within the past six weeks the jobbers in the vicinity of New York have advanced their prices between 12½ and 15 per cent. on all sizes of Pipe and Tubing. This has been done very successfully, and no advance was made in the prices quoted by the mills. The chief reason aseribed for the advance made by the jobbing trade is that Pipe is very scarce, and owing to this fact it would be nonsensical on their part to sell the goods which they have on hand at a low price, when by holding out and sticking together they can secure a much better prlee. Their judgment in the matter has been justified by the results. The consumers and the retail trade are paylng the new prices, and are paying them without much complaint. They are only too glad to get prompt service at any price. Never before has Pipe been so scarce. The claim that the scarcity was an artificial one is entirely unfounded, as there is an actual starvation iu the Pipe market, and it will take months before there will be any opportunity of catching up with the demand. The reeent hot weather shut down all of the galvanizing plants in Pittsburgh, and also all those in this vicinity, and Galvanized Pipe of all sizes is now at a premium. The ¾-ineh size has entirely disappeared from the market, and as this is the size most in demand the loss of it is felt very much by those having work to complete. Unless we have a prolonged spell of cool weather there will be no relief from the present condition of affairs. Those who have any eonsiderable quantity of Galvanized Pipe on hand will be able to net a handsome profit upon it. It is quite likely that within the next six months the Pipe situation will be so changed that prices will be considerably lower than they are at the present time. This state of affairs, of course, is conditional upon the Skelp production beiug doubled to meet the demand which will result from the new conditions. The total annual output of the mills embraced in the National Tube Company is somewhere in the ueighborhood of 800,000 tons, and the total annual producing eapaeity of the independent mills which are now in operation, together with the independent mills which are now in course of construction (not including those which are talked about, but those which are actually under way and will be completed within the next three or four months), will be about 1,250,000 tous. It can readily be seen that as soou as all those independent mills are ready to put their wares upon the market there must be a radical change in prices. The fact that the independent mills will be iu a position to turu out 50 per eent. more product than the mills operated by the trust must necessarily have a considerable effeet upou the market. It may be, however, that some of the independent mills now in course of coustruction will be bought out, or enter into some agreement with the trust, whereby they will be controlled or operated, thereby keeping the market firm. It will not be possible to tell until the mills are in actual operation what effect this enormous production will have upon the market.

Lead Traps.—On Juue 3 the mauufacturers of Lead Traps and Bends got together and formed au association of manufacturers, which adopted a new schedule of list prices, from which certain agreed discounts were to be given in all parts of the United States. This Trap list and the discounts applying to it went iuto effect immediately, on June 3. On June 25 the Manufacturers' Association issued new prices, which show an advance of 10 per cent. over the prices quoted when the list was adopted on June 3. Thls advance iu price applies on all Drawn Lead Traps and Bends, Drum Traps, Combination Ferrules and Combination Soldering Nipples and Unions. It is understood that within the next 30 days another advance, but not of such a marked nature, is likely to tako place, and it would be well for those who are not covered on this commodity to see that their purchases are made bofore August 1.

Pumps.—The manufacturers of Pumps met in Chicago on June 29 and advanced prices on all Pumps aud Cylinders made by the members of the Pump Manufacturers' Association. New prices have been made which show an advanee of 10 per cent. over the prices previously quoted.

Steel Clad Bathtubs.—The mauufacturers of Steel Clad, Copper Lined Baths and Galvanized Steel Enameled Bathtubs withdrew prices on July 2, and the new prices which have been quoted sinco then show an advance of 10 per cent. over the prices previously quoted. Tho price of Cast Iron Enameled Bathtubs and of the Composition or Nickeloid Bathtubs remains the same as those previously quoted.

Copper Range Boilers.—The manufacturers of Copper Range Boilers have advised the jobbing trade that they were compelled to withdraw all quotations on those goods, owing to tho fact that the market for the raw material has been advancing considerably of late. New prices have not yet been issued, but we understand they will show a considerable advance over those now being quoted.

Cast Iron Soil Pipe and Fittings.—The demand for Cast Iron Soil Pipe and Fittings shows no let up. It is reported to be the heaviest ever known in the history of the trade. Prices are held very firmly by the manufacturers at the full figures. Considerable scarcity is reported in some of the larger sizes. Most of the foundries are still considerably behind hand on their deliveries. Stocks in second hands are quite light.

Enameled Bathtubs.—The stringency in the supply of Enameled Bathtubs and other Enameled Sanitary Ware, which we have referred to from time to time for some weeks past, shows no abatement. There is an absolute famine of these goods in some sections. Notwithstanding that the foundries are making a full output they are from three to four months behind on their orders, and jobbers find it absolutely impossible to come anywhere near meeting the requirements of their customers. Manufacturers' prices remain at former level, but buyers who are in urgent need of Bathtubs are obliged to pay a sharp premium over quoted market rates in order to obtain prompt shipment. Even then they find difficulty in placing orders, as the stocks of these goods in jobbers' hands are insignificant.

Lead Pipe and Sheet Lead.—Under date July 10, the Colwell Lead Company, 63 Centre street, New York, announce the following net prices on Lead Pipe, Sheet Lead and Tin Lined Pipe, being an advance of 4-10 cent:

	Per pound.
Lead Pipe	5 4-10c.
Sheet Lead	5 8-10c.
Tin Lined Pipe	10 c.

Conductor Pipe and Eave Trough.—The market on Conductor Pipe and Eave Trough, plain and galvanized, is in good condition, as reflected in the volume of business and the fairly regular price of the goods, whether the product of the consolidated companies or those outside. The system of prices and discounts is devised to give the dealer North, East, South and West the goods at a uniform price. Where the freights vary compensation is made in the rate of discount according to the territory the goods are sold in.

Shot.—Under date July 8 the following revised prices on Shot are announced by the Eastern manufacturers, terms net cash 30 days, or 2 per cent. discount for cash in 10 days:

	Per 25-lb. bag.
Drop Shot, sizes smaller than B	$1.50
Drop Shot, B and larger sizes	1.75
Buck Shot	1.75
Chilled Shot	1.75
Dust Shot	2.00

In lots of 2000 pounds and upward taken at one time a discount of 20 cents per 100 pounds will be allowed.

Agate Nickel Steel Ware.—Lalance & Grosjean Mfg. Company, New York, announce a slight advance in the price of their Agate Nickel Steel Ware, the discount on which is now 33 1-3 and 10 per cent. in place of 35 and 10 per cent.

Wire Nails.—The demand for Wire Nails in New York is fair, but not altogether uniform. It is largely confined to small lots from store, which are quoted at $2.60 per keg.

Cut Nails.—The demand for Cut Nails is moderate, with considerable irregularity in prices. It is reported that Nails have been sold from store by New York jobbers as low as $2.15.

Wire.—The demand for Plain Wire continues heavy and is much larger than ever before at this season of the year. Mills are considerably behind on their orders and prices are firmly held, Plain Wire in small lots being quoted at 2.60 cents and Galvanized at 3 cents per pound.

White Lead.—The advances in price of Linseed Oil, together with the extreme heat, have reduced the demand for White Lead in Oil. No change in prices has been made, small lots of White Lead in Oil being quoted at 7 to 7¼ cents per pound.

Linseed Oil.—Another advance of 5 cents per gallon was made in the price of Linseed Oil on July 6. City Raw, in a retail way, is now quoted at 83 to 84 cents per gallon, Boiled Oil being 2 cents per gallon advance on Raw. The high price of Oil has lessened the demand, which is confined to small lots.

Spirits Turpentine.—The Turpentine market has gained strength during the week, and prices are a shade higher, the improved condition resulting from stronger Southern advices. Turpentine in small lots is quoted at 38 to 38½ cents per gallon.

A Novel Marine Torch.

A novel marine torch, in which acetylene gas is the illuminant, and of special design to insure immediate ignition on being plunged into water, is described in *Fielden's Magazine*. The torch, it is stated, "simply consists of a plain cylinder of metal, sizes varying from 3 to 8 inches in diameter and from 1 to 5 feet in length. The cylinder, which is sealed at each end, contains in a wire basket a quantity of carbide of calcium, and it also contains an air chamber to insure sufficient buoyancy. At the head of the cylinder a number of burners is arranged, adjacent to which is a small chamber containing calcium phosphide, which on contact with water generates phosphureted hydrogen, ignites and also lights up the acetylene as it issues." The torch, which has no mechanism, is automatic throughout, the only precaution necessary before plunging into water being the removal of a protecting strip of metal by pulling a ring. The illuminating power of the torch can be gathered from the fact that a 6-inch torch burns from an hour to an hour and a half with a candle power of 2000 and a flame 12 inches high, and other torches, which are rechargeable, will burn from half an hour to ten hours, according to size.

PERFORATED METALS

STEEL, IRON, COPPER, ZINC, BRASS, TIN, and all other metals PERFORATED AS REQUIRED for

Grain Cleaning and Mining Machinery, Woolen, Cotton, Paper and Pulp Mills, Rice, Flour and Cotton Seed Oil Mills, Sugar and Malt Houses, Distilleries, Filter Presses, Stone, Coal and Ore Screens, Brick and Tile Works, Filters, Spark Arresters, Gas and Water Works, Oil, Gas and Vapor Stoves, Coffee Machinery, &c., &c.

Standard Sizes Perforated Tin and Brass Always in Stock.

The Harrington & King Perforating Co.,

Eastern Office, 284 Pearl St., NEW YORK. **217 North Union St., CHICAGO, ILLS., U.S.A.**

CLASSIFIED LIST OF ADVERTISERS.

Acetylene Gas Generators.
International Heater Co., Utica, N. Y.

Agate Nickel-Steel Ware.
Lalance & Grosjean Mfg. Co., 19 Cliff St., N. Y.

Agricultural Furnaces.
Gihlin & Co., Utica, N. Y.

Aluminum Ingots.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Scrap Buyers.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Sheets.
Janney, Steinmetz & Co., Phila., Pa.

Architectural Ornaments.
Friedley & Voshardt, Chicago, Ill.

DECISION OF THE UNITED STATES CIRCUIT COURT

SUSTAINING

Lalance & Grosjean Mfg. Co.'s Label.

This Label was originated and is used by us to distinguish our ABSOLUTELY PURE

Agate Nickel-Steel Ware

from other goods, containing either

ARSENIC, LEAD OR ANTIMONY

in the enamel coating.

The Court, limiting its decision to the use of the label only, rules as follows, under date of April, 15, 1901: "Complainants may take a preliminary injunction against the use of the labels, Exhibit G (of the ***National Enameling and Stamping Co.***) or of any similar labels, which by the collocation of size, colors, shape, spacing and lettering may present as close a resemblance to complainants' label Exhibit F (see copy of label adjoining) as do the said labels. Exhibit G (on Granite Ware)."

Notice to the Trade:

The trade is hereby notified that any sales of the so-called "Granite Iron or Steel Ware" under labels like our rectangular labels referred to in above decision, is a direct infringement of our rights as established by the above adjudication and entitles us to claim damages.

Notwithstanding reports to the contrary, we are ***NOT*** members of any "Trust" or "Association," nor have we entered into any "Gentlemen's Agreement" regarding prices on Tinned, Galvanized, Japanned or Enameled Wares, or any other goods we manufacture.

LALANCE & GROSJEAN MFG. CO.,

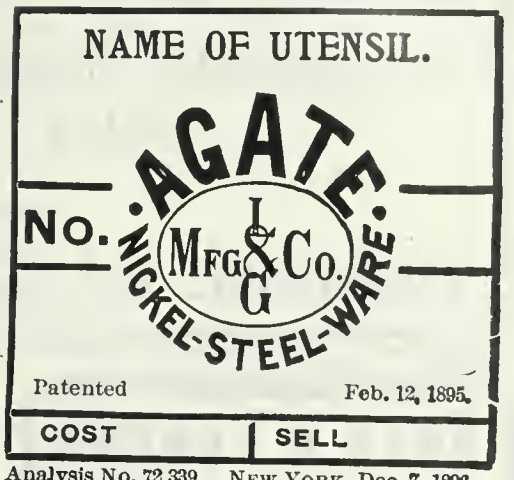
CHICAGO. NEW YORK. BOSTON.

This is a copy of the LABEL, which is printed on BLUE paper and pasted on each piece of GENUINE

AGATE NICKEL-STEEL WARE

as a guarantee of

ABSOLUTE PURITY.



Analysis No. 72,339. NEW YORK, Dec. 7, 1896.

We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.

The enamel coating is homogeneous, of extra thickness, and great purity.

It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.

Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

Pierre de P. Ricketts, E.M., Ph.D. John H. Banks, E.M., Ph.D.

Analysis No. 14,180. NEW YORK, May 5, 1897.

LALANCE & GROSJEAN MFG. CO.

GENTLEMEN:—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.

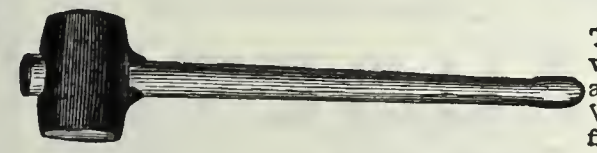
We find this enamel is *absolutely pure* and *free from Arsenic, Antimony, Lead* and *other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,

RICKETTS & BANKS,
Chemists to the N. Y. Metal Exchange.

Guaranteed Double Coated and Absolutely Pure

Copyrighted.

SPERRY'S MAULS....



This Post Maul was original with us. Imitations are made all over the United States. WE MAKE THEM RIGHT, from specially selected Pig Metal. One will do the work of a half dozen of the scrap-iron variety. If your Jobber does not give you Sperry's, order from us.

FIRST IN THE FIELD!

Our **GENUINE CHARCOAL IRON ROOFING PLATES** have been the *ONLY* IRON PLATES in the Country for years, and have well stood the test of time. Their reputation is so thoroughly established that—like all good things—they are now being imitated on all sides. Other makers are now offering what are SUPPOSED to be IRON PLATES, but you know nothing about them and, like all imitations, they are to be avoided.

See that every sheet you buy bears the stamp, and you are then sure of *THE BEST ROOF MONEY CAN BUY.*

We make Steel Plates also, in all grades, and guarantee their quality.

Catalogue Free Upon Application.

MOST OF US LIKE "FACTS."

It takes ability of a peculiar character and a high regard for truth to always give "facts." "Any fool feels competent to give advice."

Now, these are facts regarding

"Osborn's Star Old Style."

"Star" is a beautifully finished *high grade plate*, and was made especially to fill a demand for a really good plate to sell at a moderate price.

We use the same care and skill in producing this plate as is used in the manufacture of our Celebrated Guaranteed Old Style.

The tinner likes "Star." He likes its appearance. it works well. We have never placed a box of "Star Old Style" in any tin shop that has not brought forth more orders for the same goods. Our sales on this brand alone exceed that of any of the brands we handle, exclusive of Guaranteed Old Style.

The price is very low in view of the very fine quality of the plate.

We shall be very glad to submit you samples and prices upon your request.

J. M. & L. A. OSBORN,

Can't Get Away.

You can't get away from the fact that Berger's "Classik" Metal Ceilings are mighty good ones to handle

Berger's "Classik" Metal Ceilings and the right kind of a dealer make a winning combination

"BERGER'S Classik" METAL CEILINGS

help the dealer to get the business because their quality appeals to first class trade.

The designs are first modeled in clay and faithfully reproduced in the finished material, thus securing the artistic and elegant effect of plastic relief

The stamping is sharp, clear and well-defined.

Also we have valuable constructional features, reducing the number of joints and making the material easier to handle and to erect.

For up-to-date ceiling material come to us.

Write for our new catalogue. It will give you valuable light on the subject.

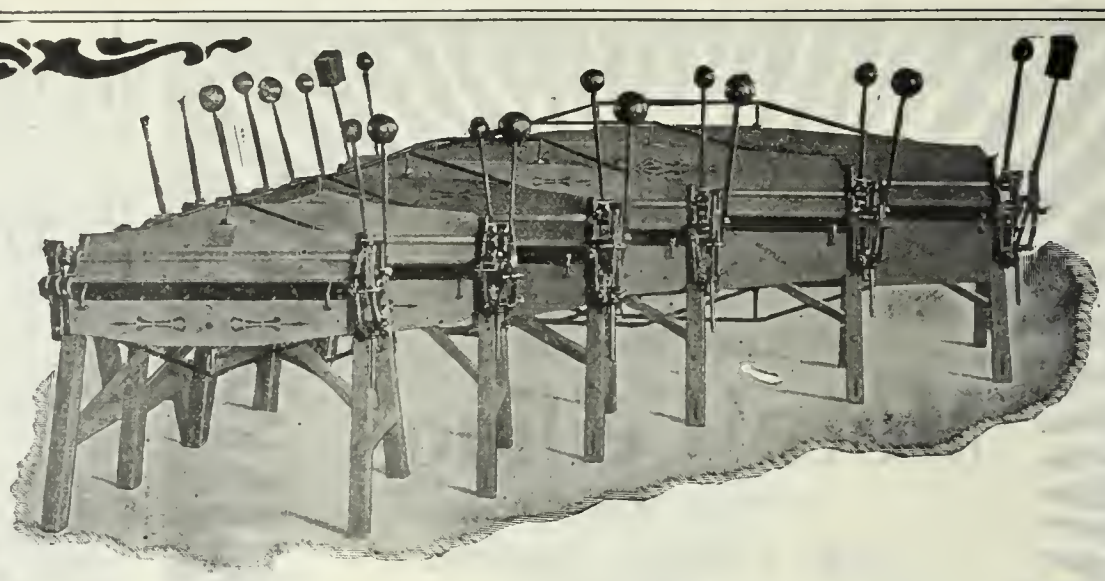
The Double Truss Cornice Brake.



All the different sizes in which we make this practical machine are herewith illustrated.

This brake costs only half as much as an all-metal brake.

It is made mostly of hard maple.

It is just as good as an iron brake in every respect—much better in some ways. Beside the 50% saved in the first cost our brake will save money in its use.

It is light and can easily be carried from place to place.

By shaping or bending work in the building where it is to be used all the trouble and expense of handling formed-up work is saved.

Write for prices.

Gray Iron Castings. S. CHENEY & SON, Manlius, N. Y.

To get a good pitch to hot air pipes in the cellar there should be a clearance of at least eight feet. To save money cellars are very often made shallower than this, and the average hot air furnace finishes too high. To meet this condition, install a Paragon Special for low cellars. The 840, with 40 inch casing and 24 inch firepot, finishes up only 5 feet high. Another evidence of the completeness and adaptability of the Paragon line.

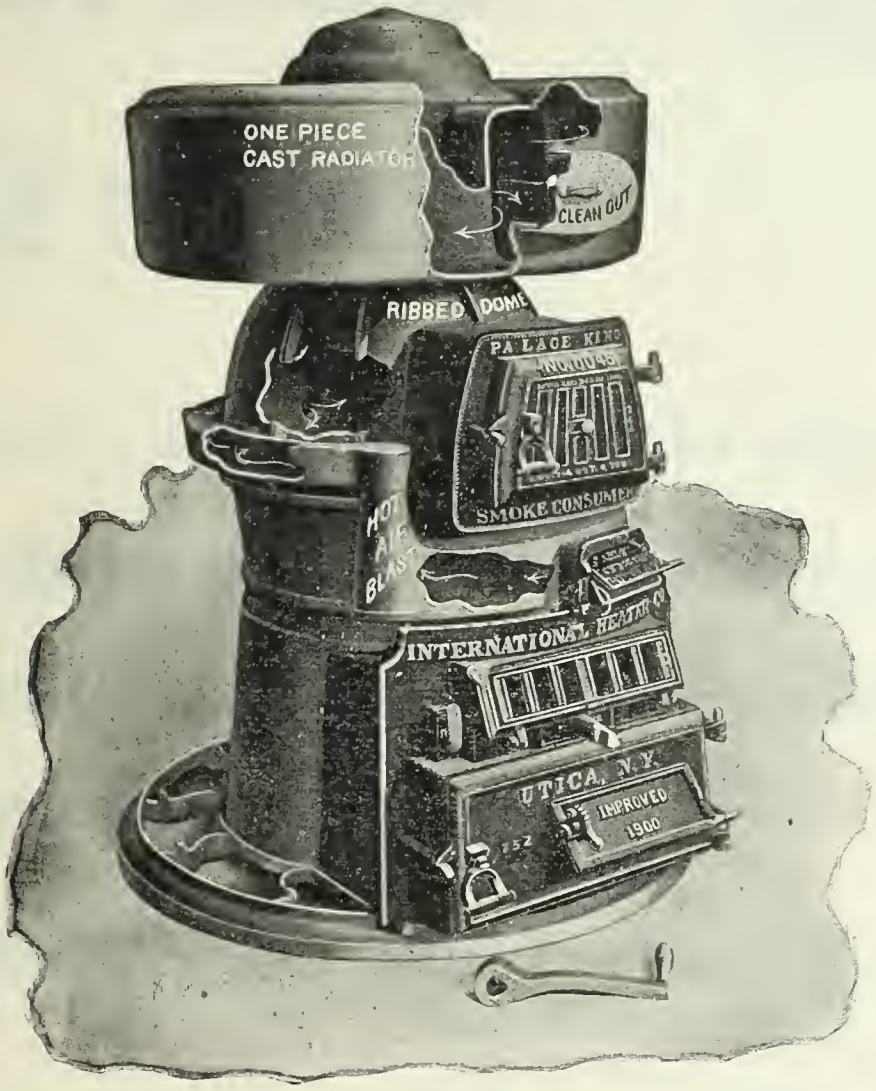
New Palace King Hot Blast

SMOKE CONSUMER

WARM AIR FURNACE.

FOR SOFT COAL.



A heavy, substantial, all cast iron and strictly high grade Heater; especially constructed for soft coal fuel.

THE HOT AIR BLAST APPLIANCE

Is so formed that the distribution of the hot air to the combustion chamber is equally divided at three points :—at the back and on each side This appliance embodies the important advantage of a hot air blast and also the very vital point of a durable construction. This question of durability of a hot blast appliance for soft coal fuel is one that has caused much annoyance and expense, and in this construction we have carefully provided for this important point. It is not a part of the combustion dome or fire-pot, insuring equal expans on and contraction. The air is discharged into the combustion chamber directly over the surface of the fire and at a very high temperature, yet the construction is such that the combustion does not come in direct c ntact with it ; the parts are allowed to expand and contract equally.

Model Oak

Entirely New Line for 1901.

We use the old name, but the numbers are different.

The Round Air Tight Register is ground into its seat on the inside of the ash pit door and will remain at any degree of opening required to supply air for combustion through the opening.

The register construction is such that the **Grate Handle** can be pulled out through the register opening

The Extension on Top of the Fire Pot extends up inside of the steel drum and is cast solid with the fire pot so it cannot twist and warp.

The Sectional Ring fits over the flange turned out on the bottom of the steel drum.

The Ash Pan fits tightly all around the edges of the ash pit.

The joints remain tight.

The price is just right.

Ask for **more information.**

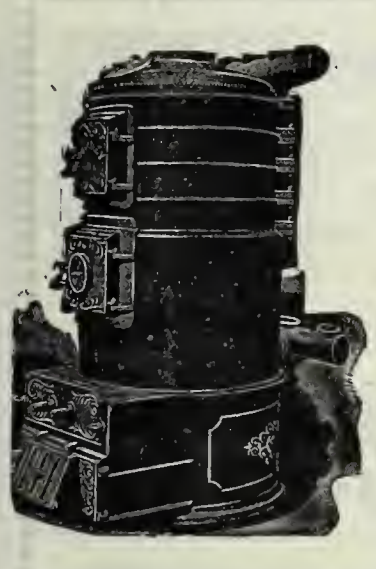
L. J. MUELLER FURNACE CO., 190 Reed Street, MILWAUKEE, WIS.

FOR EVERY SITUATION.



You know how it is. Many people can be satisfied with an ordinary heater. But now and then you run across a man who positively will not buy until he is thoroughly convinced that he is getting the best possible heater for the money.

Such a situation requires a

"GURNEY" HEATER,

because you can then assure him that it's impossible to buy any heater that is more durable, more efficient, or more economical to operate than the "Gurney."

And now: If the "Gurney" is good enough for such a situation it's the most desirable for every situation, especially ***since it costs no more than many of the less efficient heaters.*** Make it a practice to use the "Gurney" in all your work.

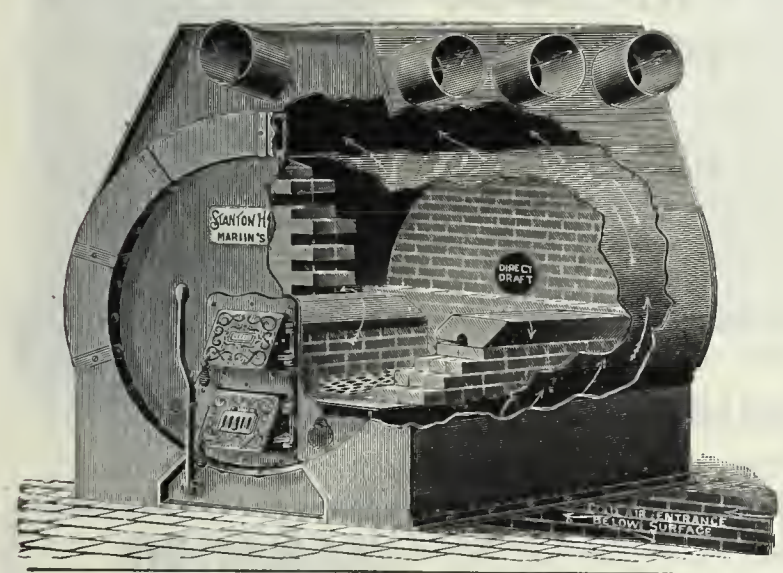
The Stanton Seamless Heater,

PORTABLE CASED.



LOUISVILLE, KY., Apl. 5th, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly
ROBINSON-HUGHES & CO

Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

The Cardinal Points with the Champion Steel Ranges are—

Simplicity,

Durability,

Superior Combustion,

Perfect Construction.

Every Champion Range sold makes friends and customers for the seller. People cannot fail to appreciate its fuel saving capacity. Otherwise it is similar and of equal capacity to any other very high grade range.

The Double Flue Hot Blast does it—saves fuel Each dealer should investigate these points. A catalogue that tells all about it for the asking.

CHAMPION STEEL RANGE CO.

CLEVELAND, O.

Something New, Neat, Novel, Ornamental and Useful.

STOVE AND RADIATOR COMBINED.

This Invention relates to improvements in the construction of stoves and is applicable to heaters, furnaces and analogous structures, and one object of the invention is to provide a large radiating surface in compact form, and to effect a thorough distribution and diffusion of the products of combustion, to the end that the energy in the escaping products may be utilized in the structure.

A further object of the invention is to secure greater economy in the use of fuel. This is accomplished by a system of radiators in combination with a combustion and hot air circulating chambers, the direct exposed radiating surface being nearly three times that of a drum. The radiators being small and out of alignment the friction is greatly increased, an important feature not found in any other style of stove.

This improved heater may be used for burning wood, coke, coal, etc. The principle, when embodied in the form of a stove, may be finished in any ornamental manner. The principle is applicable to the construction of furnaces and other analogous structures.

The products of combustion pass first through the lower section of radiators, then into a hot air circulating chamber, thence into and through the second section of radiators into the cap plate chamber, down a return flue to the exit pipe. The radiator sections are constructed and adapted for use in a heater embodying the elements necessary for a fuel consuming heater, and the result is *beauty* and *economy*, combined with *immense heating capacity*.

Am prepared to demonstrate its practicability to any interested party, or will refer to parties having them in use.

Rights for sale.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

Sent postpaid on receipt of price, $1.50.

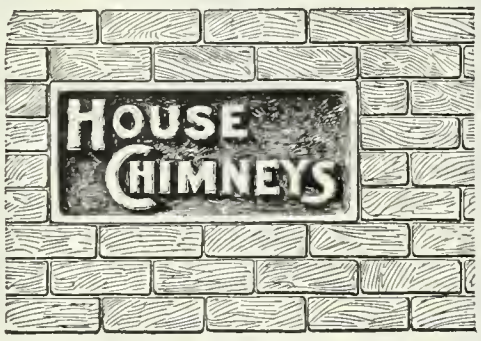
DAVID WILLIAMS COMPANY,

PUBLISHERS,

232-238 William Street, New York

A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title



Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

Page.

POINTS ON CHIMNEYS . 7–32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.

DEFECTIVE FLUES . . . 33–35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.

HOW TO IMPROVE A WEAK CHIMNEY 36–40

VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS 41–45

CONDENSATION IN STOVE PIPES 46, 47

SMOKE PIPE FOR WOOD FURNACES 48

REMEDYING DOWN DRAFT IN CHIMNEY 49–51

CONNECTED FLUES DESTROY DRAFT 52–55

FAILS TO BAKE ON BOTTOM 56–62

40 good Illustrations help to make the Text clear.

Price, Postpaid 25c.

The Metal Worker Index.

The Index of the contents of Volume LV of *The Metal Worker*, covering the first half of 1901, is now ready for distribution, and will be sent to subscribers on application to the David Williams Company, 232-238 William street, New York City.

In order to relieve those who bind or file *The Metal Worker* of the trouble of future applications for the semiannual Index, we have prepared a special list of persons to whom, in the future, the index will be forwarded without further notice. Those who are now entered thereon will have the Index mailed to them.

Living in Glass Houses.

Aecording to Jules Henrivaux, a French glass expert, who arranged the famous "Palace of Light" at the Paris Exposition, and who was until recently director of one of the largest glass works in Franee, the next age is likely to be distingnished as an age of glass. Henrivaux maintains that glass will be the great building material of the future, being the best substance known for almost any kind of structural purpose, but especially for dwelling houses. In short, if his visions are realized, all the world will be living in glass houses before very long. The elaims of this glass enthusiast are founded upon the inexhaustible supply of the materials from which glass is made, from its adaptability to all shapes and forms, its durability and its eleanlIness. Practieally every part of a dwelling, aecording to Henrivaux, ean be constructed of this material. It ean be molded lnto cornices, slates, bricks, wall decorations, panels, paving stones, and, in fact, about everything that enters into the construction of a building. The foundations and walls can be eonstructed of a variety of glass reeently invented called "stone glass," which is sald to have already withstood the severest tests. When erushed it gives a resistance three times as great as granite, and when subjected to heat and eold it is found to be less sensitive than steel. A shock, such as a hammer blow, it is elalmed to reslst to a degree twenty-two times as severe as that which would fracture marble, while the test of tension has practieally no effect on lt whatever. The walls of such a house, as described by Henrivaux in the London *Daily Express*, would be built of glass, held together by angle iron, so as to permit of a hollow spaee through which pipes could pass (the plpes themselves being of glass) conveylng hot air, hot and cold water, gas, electrie wires, drain plpes, and everything needed for the health and comfort of the inhabitants. Stairs, balustrades, eeilings, wall decorations, floors, mantels and fire places all could be constrneted of glass. Moreover, even the household furniture and utensils could be made of vitrified material. Such a house would be absolutely clean and practically indestructible. The whole of the surface could be washed from top to bottom without any humidity being left, and dust would find no resting place upon the polished surfaces. As to the question of cost, this advocate of glass claims that such a house would be fully as cheap or cheaper than a house constructed of the building material at present in general use. Glass can be made out of anything amenable to the influence of fire. The stone glass referred to is manufactured almost entirely from wha has hitherto been regarded as waste substances, such as the slag from blast furnaces and mines. To avoid the monotony which one would naturally associate with sueh a house as that described, M. Henrivaux elaims that the glass can be shaped, colored and decorated to an extent of which no other material is capable, thus providing all the variety desired. How far such a building would make a comfortable dwelling place is a matter of doubt. One great advantage, however, possessed by a glass house filled with glass furniture would be its practical immunity from fire. It may just be pos sible that M. Henrivaux has hit upon a solution of the problem of the absolutely fire proof house.

The Growth of Urban Population.

The Census Bureau has issued a bulletin respecting the urban population of the country, which contains some interesting facts. It is shown that 28,411,698 people in the United States live in eities and towns of over 4000 population. This is 37.3 per eent. of the entire population of the country, a gain of nearly 5 per cent. since the census of 1890, when the percentage of urban population was 32.9. Compared with the returns of 1880 the report shows a gain in urban population of more than one-third in percentage, and of considerably more than double in actual numbers. There were, in 1880, 580 places of more than 4000 persons, with an aggregate population of 12,936,110, or 25.8 per cent. of the then population. About one-half of the nrban population in 1900 lived in cities containing over 100,000 people, of which there were 38. There are now 1158 places of over 4000 population in the country, as against 899 in 1890. In 1790 the inhabitants of cities of 8000 or more constituted oniy 3 per cent. of the total population of the country. This indicates a remarkable change in conditions. The showing supports the conclusion often expressed that the drift of the population of this country is strongly toward the eities and large towns, for the percentage of nrban population has been steadlly increasing since the first census of the country, taken more than one hundred years ago. While the cities and towns are rapidly increasing the number of their lnhabitants, the rural dlstricts in most parts of the eountry are at a standstill, and in some quarters show an actual decline in population. No doubt the improved means of communication, together with the material attractions of

the cities, have done much to draw away from their native territories the younger country bred generation. This tendency is by no means a new one, however. It is one that has been evident in more or less pronounced form for hundreds of years past in Europe. Nevertheless it is a problem to be reckoned with.

The volume of business which was done in the New York Stock Exchange during the first six months of the current calendar year was enormous. The sales of listed stocks amounted to 151,890,696 shares, an increase of more than 100,000,000, as compared with the first half of 1900. For the entire fiscal year ended June 30, 1901, the sales of listed stocks reached the unpreeedented total of 205,910,830 shares, or nearly 110,000,000 more than in the preceding year. Transactions in bonds during the first half of this year were almost equally remarkable, footing up to a par value of $542,430,200, being over $272,000,000 more than in the corresponding months of 1900. For the full fiscal year the sales of bonds reached a par value of $814,428,500, as compared with $522,529,100 for the preceding fiscal year.

The Employers' Association of Canterbury, New Zealand, and the Canterbury Trades and Labor Council have appointed a joint committee, consisting of five representatives from each body, to discuss trade matters in an amicable fashion. At the first meeting of the committee, recently held, the subject of "Preference to Unionists" was debated at some length. This appears to be a sensible movement, and carried on in the spirit in which it has been inaugurated it is calculated to improve the relations between employers and employed. By coming together in this manner outside of working hours and discussing topics of mutual interest in a friendly spirit, each party should learn to view things from the other's standpoint. Mutual respect should be engendered and many cases of irritation and antagonism be removed. The innovation is one which deserves to be tried elsewhere.

Dun's index number, covering 350 quotations for natural and manufactured products on July 1, shows a decline in the average of prices during June amounting to 2.4 per cent., and since January 1 of 4.4 per cent. Compared with the level of prices a year ago, however, there is practically no change. Going back to the corresponding date in earlier years it is found that quotations were much lower then than now, the average of prices being 6.8 per cent. lower on July 1, 1899, and 15 per cent. lower on the same date of 1898. These changes reflect the activity of trade and the greater prosperity of the people, as quotations always tend to rise in proportion to the increased demand and the ability of consumers to spend money more freely. Last year prices in many lines were unreasonably inflated, but a readjustment has taken place this year, bringing values of products down to a more substantial basis. The moderate decline this year indicates in a great measure the elimination of fictitious values.

From all sections of the country come reports indicating that the strike of the union machinists has virtually collapsed, there being now but a very few localities where there is even a pretense of its continuance. The fact that the machinists in their recent controversy did not hold the sympathy of the public explains in large measure the failure of the strike. Having entered into an agreement with the National Metal Trades Association to submit all disputes to arbitration, the International Association of Machinists violated the same, thereby vitiating the entire agreement entered into a year ago, which, it was hoped, would absolutely prevent any such trouble as that which has just terminated.

At Weatherford, Texas, the students of the International Correspondence Schools, Scranton, Pa., have organized the "I Can Succeed Club" and have secured rooms where they can meet and study.

The Strike in the Western Rolling Mills.

What is generally incorrectly referred to as the steel strike may profoundly affect the iron industry of this country for many years to come. It is on the broader question at issue that we propose to dwell, the immediate effects upon the business being dealt with elsewhere in this issue. We have entered upon the first trial of strength between organized labor and the most conspicuous of the modern industrial consolidations.

With the decline of the sway of the puddler, as the result of the change from iron to steel, the power of the Amalgamated Association of Iron and Steel Workers waned steadily. In number and in importance the nonunion mills developed. The long depression contributed toward weakening the union organization, which, however, gained strength again during more prosperous times. There can be little doubt that the energetic work of the union leaders, aided by favoring conditions, has much increased its power during the past two years. It is only natural, too, that the creation of a series of great consolidations and ultimately of one giant corporation must have impressed labor with the neeessity of drawing closer together. And it must be a strong argument for the leaders in seeking converts among the nonunion workers that the men practically in control of the operative departments of the principal corporations have for years successfully resisted any encroachments on the part of the Amalgamated Association. The recent merging of the National Steel Company and of the American Steel Hoop Company, the latter partially union, must have made that danger appear even more imminent.

It is true that the managers of the constituent companies of the United States Steel Corporation have consistently upheld the policy of maintaining the *status quo*. In this lies the great strength of their position, so far as it affects its influence upon general public opinion. How important a factor that may be it is difficult to judge. The press is apt to overrate it.

The contention of the manufacturers is undoubtedly sound, that they could not allow themselves to be forced into the position of coercing those of their men who do not desire to join the union into becoming members of the Amalgamated Association by signing the scale over their heads. On the other hand the Amalgamated Association claims that as a matter of fact the men in the nonunion mills have voluntarily joined their ranks, and proceeds to furnish proof thereof by calling them out, with the expectation of keeping them out. The officers of the organization claim that they have gone very much further than is generally suspected, and that they have in reserve ability to lay idle other important plants.

Doubt is thrown upon this statement through the course which they have pursued in the use of the plants of the American Tin Plate Company. That company had signed the scale. Practically all the plants are union mills. It did not need any exhibition of power to prove that fact. It was not alone a stupid breach of contract, but also a grave tactical mistake. It hurts the union more than it embarrasses the manufacturers. From a broader point of view it is an evidence of weakness.

There is one phase of the subject which has not been touched upon in the discussion of it which probably weighs more with the present management of the United States Steel Corporation, and that is the attitude of the Amalgamated Association as to output. Both the tin plate and the sheet mill scales fix maxima of production in a given time, a condition which is not tolerated in other lines in any of the great steel plants and rolling mills, and which would soon check that progress which is one of the greatest triumphs of the American rolling mill and steel works managers. Once firmly in the saddle, the Amalgamated Association would soon be found arrayed against the principle of getting the possible maximum out of plant by management and by constantly improving equipment.

In the trade the feeling is that for many reasons the men and the makers will not be allowed to drift too far apart, and that a compromise will be effected in which accomplished facts will be recognized and cardinal principles will be respected.—*The Iron Age.*

The American Society of Heating and Ventilating Engineers.

FOURTH SEMIANNUAL MEETING.

The fourth semiannual meeting of the American Society of Heating and Ventilating Engineers was held on Friday and Saturday, July 12 and 13, at the Victoria Hotel, Chicago. Tho following were in attendance:

Members.

J. H. Kinealy, Washington University, St. Louis, Mo.
R. C. Carpenter, Cornell University, Ithaca, N. Y.
W. M. Mackay, Hart & Crouse Company, New York.
A. Harvey, A. Harvey's Sons Mfg. Company, Detroit, Mich.
Alvin D. Reed, engineer Board of Education, St. Louis.
James H. Davis, Warren Webster & Co., Chicago.
A. G. Paul, the Paul System Company, Boston, Mass.
August Kehm, Kehm Bros. & Mectz, Chicago.
C. G. Folsom, South Bend, Ind.
A. T. Kellogg, Kewanee Boiler Company, Kewanee, Ill.
John D. Hibbard, John Davis Company, Chicago.
C. V. Kellogg, Kellogg-Mackay-Cameron Company, Chicago.
T. J. Waters, chief engineer Board of Education, Chicago.
C. M. Wilkes, Chicago.
J. J. Blackmore, J. L. Mott Iron Works, New York.

Guests.

S. F. McDonald, the Paul System Company, Chicago.
G. E. Downe, American Radiator Company, Chicago.
D. F. Morgan, D. F. Morgan & Co., Chicago.
Oliver Schlemmer, Jr., Cincinnati.
L. E. Riddle, Kansas City, Mo.
P. J. Markmann, Chicago.
Thos. K. Peters, St. Louis.
I. A. Hardy, American Tobacco Company, St. Louis.
Jas. J. McDonald, Chicago.
B. E. Van Auken, Van Auken Bros. Company, New York.
C. B. Thompson, American Radiator Company, Chicago.
Benjamin Kauffman, the Paul System Company, Cincinnati.
A. K. Park, the Paul System Company, Cleveland, Ohio.
James McAlear, the Paul System Company, St. Paul, Minn.
H. W. Ellis, Johnson Temperature Regulator Company, Chicago.
L. H. Drury, Jenkins Bros., Chicago.
D. E. McCabe, International Heater Company, Chicago.
J. F. Leslie, Mishawaka, Ind.
P. S. Hudson, Western Tube Company, Chicago.
J. F. Harmon.
Chas. M. Howe.
J. L. Welshaus.

Trade Press.

Chauncey Williams, *Engineering Review*, New York.
H. T. Sherriff, *Domestic Engineering*, Chicago.
Geo. W. Cope, *The Metal Worker*, Chicago.
E. E. R. Tratman, *Engineering News*, Chicago.
W. W. Macon, *Engineering Record*, New York.

FRIDAY AFTERNOON

The opening session was held on Friday afternoon with the following officers:

President, Prof. J. H. Kinealy of St. Louis.

Secretary, W. M. Mackay of New York.

The secretary read the list of nowly elected members, as follows:

Enoch Rutzler, New York.
Frank P. Blodgett, New York.
Charles R. Bishop, Lockport, N. Y.
George B. England, Brooklyn, N. Y.
August Kehm, Chicago.
Alfred S. Hamlin, Newark, N. J.
William K. Downey, Milwaukee, Wis.
Henry B. Gombers, New York, associate member.
Joel I. Lyle, Syracuse, N. Y., junior member.

After the roll had been called the president welcomed the members to the first meeting of the society that had been held in the West. He called attention to the high character of the papers to be read and invited free discussion.

An invitation was read from President Maguire of the British Institution of Heating and Ventilating Engineers, to attend their next meeting, to be held at Dublin on July 23 and 24. A suitable acknowledgment was ordered.

Papers.

Prof. R. C. Carpenter read a paper on "The Effect of Circulation on the Capacity of Fire Box Heating Surface." The paper was illustrated by large wall diagrams, which enabled the members to readily comprehend the apparatus employed by the author. Numerous questions were asked, most of which traversed the ground covered by the paper and simply called for more elaboration of the points made. The president said that he considered the most interesting result of the experiment was the increase of circulation with the increase in heat, which would seem to prove that a small boiler is more efficient than a large one.

C. G. Folsom read a paper on "Hot Air Furnace Heating," which was also illustrated by large sketches. A description was given of a heating job installed at South Bend, Ind., the building being exposed on all sides. The furnace used was a Hoffman tubular, furnished with a rocking grate. The furnace had 14 pipes. The stacks used were 4 x 12 and sometimes 4 x 14 inches. The house had 31,000 cubic feet to heat, while the capacity of the furnace is rated by the manufacturers at 30,000 to 40,000 cubic feet. Full details were given of the runs of pipe, air inlet, &c. Tho furnace has worked very satisfactorily, the temperature in the morning being 68 to 72 degrees. This was done notwithstanding the pitch of the pipes was only 1 inch to 10 feet, which is much less than is considered good practice, but which was rendered necessary under the circumstances. Circulation was, however, induced by a system of exhaust pipes, taking foul air from the rooms. Only 10 tons of anthracite coal were used during the entire heating season.

A short discussion ensued.

Prof. R. C. Carpenter then read a paper, presented elsewhere in this issue, on a "Test of Radiators with Superheated Steam."

The question was asked whether a point had been established by the experiments at which the greatest efficiency had been realized. Answer was given that this had not been established, but that the fact was demonstrated that the steam should be used at as low a heat as possible.

Mr. Paul raised the point that superheated steam absorbs water rapidly and thus the heat given out by radiator is affected by the condensation in the radiator, as the superheated steam enters the radiator at the bottom. Professor Carpenter combated this, stating that superheated steam being of the nature of air does not part with its heat rapidly and therefore does not quickly absorb water. Mr. Paul replied that he had not been able in his practice to carry superheated steam any distance. This point brought ont quite a protracted discussion.

Discussions.

Topical discussion was then taken up. President Maguire of the British Institution suggested the first question brought up, which was that of

Furnishing plans and specifications to architects without compensation.

Several members gave their views relative to this practice, and the sentiment appeared to be that it depended on the amount of business pressing. If a steam fitter had one job and 25 came up to be figured on the situation would be very different from having 25 jobs in hand and one to figure on. Secretary Mackay believed that through a conference with the American Institute of Architects this question will shortly be settled so that the heating engineer will be paid for his plans. Mr. Wilkes stated the difficulty in engineering large buildings, because of the conflict of wiremen, plumbers and steam fitters.

Is it advisable to advocate the adoption of the metric system?

Professor Carpenter opposed the metric system. He stated that the English regarded their currency system as a great educational advantage because without it the masses would lack the strong incentive to any men-

tal activity which comes from learning how to reduce English money.

Mr. Blackmore differed from Professor Carpenter, arguing in favor of simplicity in everything.

Mr. Hibbard also favored the metric system, especially in view of the growth of foreign trade.

The meeting then adjourned.

FRIDAY EVENING.

A paper was read by Alvin D. Reed of St. Louis descriptive of the heating system in St. Louis schools. It was illustrated by lantern slides, giving exterior views of two of the school buildings and plans of piping, air ducts, &c. The schools described are heated on the hot blast system, air being driven through steam heated coils by a fan operated by a steam engine. The engine is run by steam from the boiler used for heating the coils. The boiler is kept at 15 pounds or under, because of a city ordinance which permits steam systems of that pressure to be operated without requiring a licensed engineer.

Numerous questions were asked relative to details of the system, which were answered by Mr. Reed.

Topical discussion was then taken up and the following question was read:

What system of ventilation is most advisable for hospitals?

The president made some general remarks on this subject, hoping to induce a discussion, but either the hour was too late or no one felt sufficiently interested in it, and the convention adjourned.

SATURDAY MORNING.

W. M. Mackay read a paper, presented elsewhere in this issue, on "The Volume of Water in Hot Water Heating Apparatus."

In the discussion which followed Professor Carpenter said that the statistics given would be of very great value to engineers. C. B. Thompson gave his views relative to the construction of boilers to secure efficiency on the lines laid down.

Discussion.

Topical discussion was then taken up on:

What is the life of metal air ducts and under what conditions can they be dispensed with?

Messrs. Reed, Folsom and Mackay discussed this question. Mr. Mackay gave an interesting account of the method employed in the construction of air ducts in some large British institutions recently visited by him. In these buildings suitable flues were constructed in all walls or partitions and no metal ducts are used. The next topic discussed was:

Why not use small ducts, high velocities and high pressures in ventilating work?

Professor Carpenter, Mr. Reed and others contributed to this discussion, which favored large ducts and moderate pressures.

What is your experience as to the use of wrought iron or steel nipples in connection with cast iron radiators? was the next topic discussed.

Mr. Mackay said that his experience has shown that wrought iron nipples are all right. Trouble has arisen with steel nipples, but he believed because they have been made thinner than the old wrought iron nipple. Wherever trouble had arisen it was for some other reason than that the cast iron sections are put together with wrought iron or steel nipples. Mr. Blackmore said that steel nipples as now made are proving very satisfactory. Professor Carpenter had found in a number of instances that nipples had given way and believed that it was due to the water attacking the steel or wrought iron more actively than the casting.

The topic, *What has been your experience in the use of anemometers?* was then discussed.

This brought out an interesting statement from Professor Carpenter of the manner in which an anemometer should be used. Mr. Reed said it was a hard matter to get two readings alike. Mr. Folsom had tried to use the instrument but with little satisfaction. Professor Kinealy said that the fewer the parts the better will be the anemometer.

The Close.

The secretary stated that invitations had been received from local members for the society to visit important buildings in Chicago to inspect heating installations. In view of the fact, however, that the members desired to make visits individually, and it would therefore be difficult to make up a party or several parties, the thanks of the society were formally tendered for the invitations with regrets that they could not be accepted. The convention adjourned *sine die*.

The officers of the society are greatly pleased with the success of their first Chicago meeting, and believe that it will result in material additions to their membership. Quite a number of applications already have been received from those who attended as guests and thus had a practical lesson in the methods and benefits of the society.

David U. Cory.

The members of the New York City stove trade were greatly shocked by the sudden death from heart failure of David U. Cory, which occurred at the residence of his sister in Englewood, N. J., on Saturday, July 13. Mr. Cory was the head of the house of Uzal Cory & Co., New York City, one of the pioneer concerns in the manufacture of hot air furnaces. He entered the business as a young man and gave to it earnest study, which resulted in his acquiring an expert knowledge that was surpassed by few members of the furnace trade. Those who knew Mr. Cory will keenly feel his death, for he was a man who commanded the highest esteem for his altogether admirable character. All of his business dealings were characterized by the most unswerving integrity, which would not directly or indirectly countenance anything that savored of sharp practice. He was, moreover, intensely human in his interests, and inspired feelings of the warmest friendship among all who knew him. Mr. Cory was in his fifty-second year, and is survived by a widow, two sons and a daughter.

Garland Oak Stoves.

A trade edition of the *Garland Magazine*, just issued by the Michigan Stove Company, is devoted exclusively to Oak stoves. The company claim their line to be the most complete line of Oak stoves ever offered to stove buyers. It comprises the Oak-Garland, Jr., described as a good Oak at a moderate price; Oak-Garland, G series, with square base, described as a first-class and perfectly constructed Oak stove, perfectly air tight; New Oak-Garland, H series, square base, claimed to be the handsomest and best proportioned Oak stove now made; and Front-Flue Oak-Garland, described as "the selling sensation of the age," being of original construction, giving two large front full base heating and self cleaning flues to an oak stove. All these styles are handsomely illustrated and fully described in the magazine. Construction details are separately illustrated, such as the combination screw register and grate shaking door and the gas burning fire pot. The former is a device for absolutely sealing a stove and thus making it air tight, while the latter secures through a supply of heated air intense and perfect combustion in the fire pot. These stoves are adapted to the use of hard or soft coal, coke, lignite or wood.

W. F. Adams, 1829 Adams street, Toledo, Ohio, who makes a specialty of the Kelsey Warm Air Generators, is sending to possible Furnace customers an invitation to examine the apparatus. The letter inquires if thought has been given to the character of the air found in the average home, and calls attention to the disadvantages of overheated air and the effect of outdoor exposure on those who breathe it. He further states that a pure, mild, warm atmosphere can only be secured by passing pure, fresh air in abundant quantity over radiating surfaces that are not overheated.

AMERICAN STOVES IN EUROPE.

BY CHAS. F. HAUSS, BERLIN.

Before an American stove manufacturer tries to do business in Europe, the writer would advise him to make a study of the conditions, fuel, &c., and learn exactly what is wanted. His printed matter should be in German and French, all dimensions and weights in the metric system of weights and measures. It is important to give either the fire or heating surface of the stove in square meters or the number of cubic meters of space it will heat, approximately.

To send out English printed matter is a waste of money, and to insure the reading and consideration of any catalogue or circular it is absolutely necessary to put sufficient postage on it, for nothing will anger a European quicker than to receive mail with short postage—as the law here compels the receiver to pay the shortage as well as a fine of 100 per cent.

American stoves are used to some extent, but only with anthracite coal, and then only with changes in the draft doors, &c., to suit European ideas. Several German manufacturers make what they call an "American stove system Perry," in round and square form, but there is little demand for them owing to their being limited for economically burning anthracite coal only, which is very expensive. The fuel most used is gas coke and briquettes made from lignite or brown coal.

For the successful and economical burning of coke a flat, permanent grate is necessary, with 33 1-3 to 50 per cent. of air space, that is divided into ⅜ inch to ½ inch spaces of air and iron. In connection with this grate there should be provided a clinker door and screw draft regulators, such as are used on American Oak stoves.

For burning briquettes a very fine grate with, say, ¼-inch air spaces or just a flat plate is used. These briquettes or pressed coals are made of lignite dust and screening, held together with some adhesive compound and pressed into the shape of bricks and eggs. When this fuel, as well as the coke, is in a certain state of combustion on a shaking, revolving or coarse grate, and there is a violent movement of the same, it runs through the grate like water through a sieve, with the result that the grate is burned out. Hence the absolute necessity of providing a flat, permanent grate.

Care must be used in the fitting of all doors and parts so that positive regulation of the drafts is possible, and where coke is to be the fuel a magazine is indispensable. The American Oak stove comes nearest the European idea and lacks only the grate above mentioned. Where this stove is made entirely of cast iron—that is, without the sheet iron casing, it would be best received and have the advantage of a lower duty.

Packing stoves for export is a very important matter, not only to prevent breakage due to the frequent and rough handling the goods receive, but to reduce the duty. For instance, if a door has brass hinge pins in it or a nickel plated handle on it, the whole door will be weighed and duty charged at the rate of brass or nickel plated ware; or if a nickel plated rim be fastened to a stove body the whole body would be weighed as nickel work. Hence the importance of packing each class of material separately. I give here the duty into Germany:

Rough or unfinished castings, 27¼ cents per 100 pounds.

Fitted or partly finished castings, 65 cents per 100 pounds.

Polished cast iron or wrought iron work, $1.10 per 100 pounds.

Nickel plated or brass parts, $2.60 per 100 pounds.

The duty on fitted castings into Russia is practically prohibitive, being $5.40 per 100 pounds, while the duty on the same goods into France is $2.25 per 100 pounds, into Switzerland 55 cents per 100 pounds, and into Austria $1.72 per 100 pounds. Holland imposes only 5 per cent. ad valorem and Belgium 15 per cent. ad valorem.

Finally, the salesman sent must know all about the goods he tries to sell, be prepared to answer an unending lot of questions, and his patience must have no limit.

THE CHICAGO HEATER & SUPPLY COMPANY, Chicago, have been licensed to incorporate with a capital stock of $25,000 for the purpose of manufacturing and dealing in Furnaces and Heating Supplies. The incorporators are C. M. Converse, T. B. Emery and E. B. Smith.

THATCHER RANGES.

As evidence of their desire to aid their customers to secure a generous proportion of the range trade, the Thatcher Furnace Company of 240 Water street, New York, have just issued a 24-page catalogue devoted to the Thatcher ranges. It is 10½ x 7½ inches in size, in a three-color effect, with a light maroon for the background. The title page of the catalogue bears the name and address of the company and the names of the officers. The statement is also made that the business was established in 1850. The general office and salesroom of the concern are at 240 Water street, New York, while their manufacturing plant covers an entire block in Newark, N. J. The introduction calls attention to the excellent reputation enjoyed by the Thatcher ranges, due to the many features of excellence and convenience provided in their construction, and announces the addition of some new goods to the line. It also states that the company are manufacturers of hot air furnaces, combination heaters and steam and hot water boilers. Another page gives terms and suggestions for aiding the prompt shipment of orders.

The earlier pages of the catalogue are devoted to the Thatcher double oven range, made with low warming closet, adapted for use with a high shelf and canopy, and for setting between brick jambs or against an enameled brick back. This is followed by the Thatcher single oven range, which is made both right and left hand, and provided with water back suited for heating large vertical boilers, or supporting horizontal boilers. These ranges are furnished with canopies, low warming closets and warming shelves, and are also adapted for setting between brick jambs or against enameled brick backs. They are all provided with the Thatcher patent triangular revolving grate. In addition to their already extensive line of these ranges a new size makes its appearance with this catalogue, having six 7-inch holes, an oven 14 x 15 x 10½ inches, and a top 34 x 25½ inches in size.

Several pages of the catalogue are used to introduce the Thatcher French steel ranges, made with both single and double ovens. These ranges are offered in various sizes and styles, adapted for hotels, institutions, apartment houses, family use and steamships and yachts. Two pages are occupied by the Active laundry stoves, with a two-hole boiler top and capacity for heating nine irons on the side, and the Sterling hot water laundry stove, having a square, flat top. One page is devoted to pictures of the Thatcher tubular furnace and the Thatcher sectional steam boilers, and the text invitingly presents the features of these apparatus for consideration. A picture of the company's plant at Newark, N. J., is given on the last page.

White's Stoves and Ranges.

The Thomas White Stove Company, Quincy, Ill., have favored us with a copy of their thirty-ninth annual catalogue and price-list. This is a handsome publication, comprising 112 pages, and is substantially bound in cloth with a gilt title on the side. The goods shown cover a very full line of coal and wood cooking goods, as follows: Maxim steel range, in four sizes; Model steel range, in eight sizes; Model steel cook, in five sizes; Peerless steel range, in eight sizes; Peerless steel cook, in five sizes; Rival steel range, one size; Rival steel cook, one size; Victor cast range, six sizes; Prize cast range, seven sizes; Clipper range, three sizes; Victor cook, five sizes; Prize cook, four sizes; Winner cook, three sizes; Clipper cook, three sizes; Harmony cook, two sizes; Grand cast range, six sizes; Herald range, five sizes; Champion range, four sizes; Magnet range, three sizes; Grand cook, three sizes; Herald cook, four sizes; Champion cook, four sizes; Magnet cook, three sizes; Premium cook, three sizes; Gem City cook, six sizes; Pride cook, two sizes.

The display of heaters embraces cast and sheet iron

Todd stoves, box stoves and drnm stoves for wood and Oaks and air tights for coal. They are named as follows: Royal Princess, Princess, Rainbow, Novelty, Ruby, Derby, Ocean Wave, Snowbird, Trinmph, Hot Blast, Snperb, Poplar, Argus, Reward, Jewel, Trump, Climax and Silver.

As a distinctive name, nearly all the stoves put out by this company bear the prefix "White's."

The Jahant Furnace.

A new catalogue devoted to the Jahant hot blast furnace has jnst been issued by Rohrbacher, Allen & Jahant, Akron, Ohio. It consists of 64 pages bonnd in a drab cover, printed in red and blue and showing a broken view of the furnace. The introdnction states that no changes have been made in the construction of the furnace, but that a one-piece cast iron radiator has been added to the line, adapting it for a wider nse. The text treats in detail of the construction of the fnrnace and dwells largely on the method of snpplying a blast of hot air at the snrface of the fire, promoting combnstion of such a character that when the varions grades of soft coal are consumed, the usual deposits are avoided, and the carbon that is ordinarily carried off in the form of dense smoke is consumed usefully for the generation of heat. The catalogue gives fnll instructions for setting the furnace and for regulating it in use.

In order that its constrnction may be thoroughly nnderstood views are presented showing the fire pot, which is made in two pieces, and the grate construction, which is of the labor saving type. Water coils for heating a water tank or radiators are also shown. Separate views are given of both steel and cast iron radiators, also the company's draft regulator. One page contains a table giving fnll dimensions and capacities of the furnace, and another page has dimensions for making the casings of the five different sizes of Jahant furnaces. Price-lists are also given of different styles of radiators. Under a separate head are suggested important questions which must be considered in heating buildings, and excellent information is presented in reference to chimneys, it being pointed out that the successful operation of any heating apparatus depends on the chimney draft. The last half of the catalogne contains testimonials, inclnding 18 pages of letters giving detailed information of the fuel consumption and heating capacity of the furnaces from those who have used them in stores, chnrches or residences. The book closes with a long llst of names of churches, schools, public bnildings and residences where the Jahant hot blast furnace is giving satisfactory service to the user.

Red Cross Stoves and Ranges.

The thirty-fifth annual catalogue of the Co-operative Foundry Company of 15-19 Hill street, Rochester, N. Y., is a handsome publication of 144 pages, printed in two colors upon a good quality of paper, profusely illnstrated with well executed engravings of an extensive assortment of attractive goods, and bound in flexible covers of appropriate design. The main feature of the cover is a section of a molding floor, with a molder represented carrying a ladle of molten metal. At the right and left hand in red are *fac-similes* of the company's Red Cross trade-mark, with the dates 1901 and 1902, while in the lower left hand corner is the address of the company, with the number of the catalogue. Jnst before the title page are two views of the company's works, one representing the offices, fonndry and warehonse on Hill street, and the other the foundry and warehouse at Lincoln Park.

In their introdnction to the trade the company state that they will "spare neither pains nor expense to perpetuate the high degree of popularity which has been secured for the Red Cross products, and to maintain the standard of excellence in the device and design in pattern construction." The leading place is given to the Red Cross Victor, a new steel range of fine proportions and rich exterior. Constructively it embodies the latest improvements and is offered in the usual styles and sizes, several of which are illustrated. The Red Cross Princess is another member of this class of range, following which are cast goods. The ranges occupy something over 40 pages of the catalogue, after which attention is given to gas cooking attachments with directions for use, these in turn being followed by cooking stoves, which occupy 15 pages, all being offered nnder the generic name Red Cross. The heaters, with the Royal Red Cross in the leading place, take up, in connection with the Red Cross warm air furnaces, farmers' boilers, kettles, stove hollow ware, &c., the remaining portion of the catalogue. A feature that will be fonnd of special interest is the directions for operating stoves, issued by the National Association of Stove Mannfactnrers, and extracts from various pnblications respecting chimneys, drafts, &c.

Quick Meal Steel Ranges.

The Ringen Stove Company, 410-414 North Sixth street, St. Lonis, Mo., have just issned what is known as Catalogue No. 48, covering the season from July 1 of the present year to Jnly 1, 1902. The 48 pages are devoted to illustrations of the Quick Metal steel ranges, which are offered in a great variety of styles and sizes adapted to meet many reqnirements. Specal attention is called to the fact that the walls, consisting of heavy cold rolled steel, are dipped and finished in black enamel and baked in a kiln at 300 degrees F. This, it is claimed, gives a smooth, hard and glossy finish and one that is much more satisfactory than if the metal was palnted. The oven top and sides are made from one piece of heavy steel, the top being arched so as to make it especially strong. The oven door is double, with an air space between the two sheets, which ventilates the oven and tends to prevent the nickel from tarnishing. The fire box is large and the grate is of the duplex variety.

A line of ranges entirely separate and distinct from tho enameled line is made with a body of pollshed blue steel. The fire box is made in one size only, the linings are sectional, ventilating and heavy, and the oven is made of one solid piece of steel, as is also the oven door. Several pages in the catalogue are devoted to cuts for advertising purposes, a series of testimonial letters from some of those who have used the Quick Meal goods and some remarks about private postal cards which the company have issued, giving inside and ontside views of the Quick Meal factories and the Ringen Stove Company's bnilding.

Welcome Stoves and Ranges.

Among the more attractive trade pnblicatlons which have reached onr desk thns far in the present season may be mentioned the catalogne of Welcome stoves and ranges, agricultural furnaces and dealers' snpplies jnst issued from the press by the Syracnse Stove Works of Syracnse, N. Y., and with New York City office at 231 Water street. The form of the catalogue, or rather the shape of the page, differs somewhat from the general rnn of stove trade publications in that the hight of the page is very much greater than the width, the printed matter being so presented as to leave an unusnally wide border at the top and bottom. This, with the two-color work, gives a very rich effect as one runs over the pages. The binding is in deep green paper covers, embellished with an old gold panel, carrying in black and green the words which constitnte the title of this revlew. Beneath the panel in the same general style of treatment are clasped hands, symbolic of "Welcome."

In referring to the constrnction of their goods the company state that the cast iron composition entering into them is especially selected and scientifically blended, giving an iron of great strength, tenacity and wearing qnalities. The mounting and fitting of the stoves is done by day labor and not by the piece, while particular attention is given to the nickel plating and metal work. Throughont their entire establishment the machinery nsed is of the latest labor saving and improved description, and it is by giving careful attention to such details that the company are able to tnrn ont snperior goods. The Welcome ranges occupy one-half of the catalogne, or 50 pages, with the following 12 pages devoted to cook stoves and the remaining portion to heaters of varions kinds, caldrons, price-lists of fire brick, directions for operating the stoves, and a comprehensive index alphabetically arranged.

ODD PLATES.

FURNACEMEN who use a drawing board in preparing working plans for their furnace work will be pleased to receive from Isaac A. Sheppard & Co., Philadelphia, a little board containing a set of thumb tacks. These thumb tacks alternately bear the words Paragon Furnaces and Boilers and Excelsior Stoves and Ranges, the names Paragon and Excelsior being in red and the other lettering in blue on a white ground.

THE SPRINGFIELD FURNACE COMPANY, Springfield, Ohio, are just sending to the trade a 34-page catalogue descriptive of the Thompson Warm Air Furnace, designed for using natural gas or oil fuel. The Furnace is of a construction which exposes a large amount of hot surface to the air passing through it. The gas or fuel burners are placed in a chamber and the products of combustion rising from them not only take an indirect course through the apparatus, but are thoroughly distributed over the surfaces presented. The catalogue has much to interest the Furnace heating contractor in districts where natural gas or oil is used for fuel.

AT the annual meeting of the stockholders of the Somerset Stove Foundry Company, held at their office in Somerset, Mass., the following officers were elected: President, A. H. Hood of Fall River; treasurer, William H. Tallman, and clerk, D. Borden Davis. The directors include A. H. Hood, A. N. Lincoln and J. D. Flint of Fall River; G. E. Marble, William H. Tallman and D. B. Davis. The auditor is Charles S. Simmons. Among the shipments recently made by the company was a consignment of 90 Ranges to a firm in San Francisco, which, it is expected, will take 360 Stoves per year from the company. Business prospects are said to be brighter than ever.

SOME extensive alterations are being made at the works of the Rossmore Company in Peekskill, N. Y. In order to accommodate their increasing business it has been found necessary to erect an addition and make some other changes which will place them in a position to more promptly meet the demands of their trade.

THE PRIZER-PAINTER STOVE & HEATER COMPANY of Reading, Pa., have found it necessary, on account of the rapid growth of their business, to increase their capital stock from $200,000 to $350,000.

DURING the recent hot spell Gould & Fruchey, proprietors of the Marion Stove Works, Marion, Ind., closed their plant for a week in order to give the men a much needed rest and to make some necessary repairs.

THE COLLINS & BURGIE STOVE COMPANY, at Marengo, Ill., shut down the second week in July for the usual inventory and in order to make some necessary repairs and alterations. We understand that the past year has been one of the most successful since the works were started, and the prospects are very flattering for the future.

GEORGE D. ROPER, president of the Eclipse Stove Company of Rockford, Ill., was recently in New Orleans in the interests of his company, calling among others upon the manager of the New Orleans Lighting Company, relative to increasing their supply of Gas Stoves. Mr. Roper states that the demand for Gas Stoves in New Orleans exceeds anything in the history of the business, so far as he has knowledge. He is of the opinion that New Orleans is better adapted than any other city to use Gas Stoves, the climate rendering them a necessity on account of their cleanliness and the readiness with which they may be put in and out of operation. We understand that he secured an order for 4000 Stoves, to be shipped as soon as they can be gotten out.

THE BUCKEYE FOUNDRY COMPANY of South St. Paul, Minn., have recently taken out a permit for the erection of a factory to be located on the west side. We understand that the product of the new concern will be Stove Castings and Repairs.

THE SCRANTON STOVE WORKS of Scranton, Pa., have erected an addition to their foundry which will give them accommodations for 25 more molders. The company are bringing out several new Ranges and Parlor Stoves, and the works are busy in all departments.

IF the vaticinations of the Gobeille Pattern Company, Cleveland, Ohio, are to be believed, the long looked for consolidation of the Stove plants of this country will shortly be an accomplished fact. It is possible, however, that this enterprising firm of pattern makers have rashly dipped into the future merely for the sake of argument, they holding that if the companies are to enter the consolidation the more new and up to date lines of Stoves they possess the better the price they will secure. Therefore, the end of the argument is, get new patterns and, of course, go to the Gobeille Pattern Company for them.

THE SIMPSON STOVE & MFG. COMPANY of Pittsburgh, Pa., are distributing a four-page folder calling attention to Simpson's Gas Range intended for using natural gas as a fuel, the Duquesne Cookers and Ovens, and to the Duquesne Hot Plates, which are made with two and three burners. The Gas Range has four large cooking holes in the top surface, with removable rings, and four top burners. The oven is square and ventilated, and the broiler is equipped with pan and rack. The body is made of sheet steel, asbestos lined and finished in hard baked japan. The oven door frame, name plate and lower door and valve line are highly nickel plated.

THE READING STOVE WORKS, Orr, Painter & Co., Reading, Pa., are distributing among the trade a six-page folder setting forth the merits of the Sunshine Oak, which has been remodeled and improved for the present season. It is made in five sizes and so constructed as to produce a maximum amount of heat from a minimum quantity of fuel. It is supplied with grates for hard coal, soft coal or wood, which are interchangeable without trouble or inconvenience. The shaking grate is on rollers, making its operation smooth and easy. The Sunshine Oak is also made as a double heater and is of handsome exterior.

TRADE NOTES.

H. R. BRUCE & Co., manufacturers' agents, whose office formerly was at 418 Pike Building, Cincinnati, Ohio, have removed directly opposite to 419 in the same building. The change was made in order to secure greater space for the display of samples of which the firm carry an extensive line.

THE E. F. REECE COMPANY, INCORPORATED, of Greenfield, Mass., have issued a 64-page catalogue of their Screw Cutting Tools for machinists, blacksmiths, bicycle and electrical work.

THE WITMAN MFG. COMPANY, Columbus, Ohio, are distributing a small four-page circular relating to their Incandescent Mantles for natural, artificial and gasoline Gas Lamps.

THE NORTH CAROLINA MICA COMPANY of Boston, Mass., have shipped a large lot of their product to the London market.

THE ACORN BRASS WORKS, Chicago, Ill., are making some substantial shipments of their specialties to Cape Town, South Africa.

THE UNITED SCRAP IRON & METAL COMPANY, 515 Baltic avenue, Atlantic City, N. J., have been incorporated with a capital of $10,000 by John McBlane, James Lamont, Edwin Denny, Edwin W. Edwards and others, to deal in Scrap Iron and Metals.

THE REFLECT INCANDESCENT LAMP COMPANY of Phillipsburg, N. J., have been incorporated by James W. Cowell, Howard P. Kinsey and others with a capital of $300,000, to manufacture Lamps and Reflectors.

THE New York branch of the Joseph Dixon Crucible Company, 68 Reade street, has just been thoroughly overhauled and renovated, even to new fronts, signs, &c. Inside, a new metal ceiling, tinted in colors, has been put, new system of electric lights installed, and the interior painted and renovated throughout.

THE WESTERN STAMPING & ENAMELING COMPANY have been incorporated by W. H. Sweeney, W. K. Gore and others, with a capital stock of $100,000, to operate the enameling works at Dubuque, Iowa. W. H. Sweeney will act as manager.

Protector Woven Steel Covered Hose.

The National Supply Company, 5 and 7 West Lombard street, Baltimore, Md., whose New York agents are Allerton-Clarke Company, 97 Chambers street, have just put on the market the Protector woven steel covered hose, as here illustrated. The galvanized spring steel covering, which permits the hose to be coiled for shipping or putting away in small compass after use, also makes it especially desirable for air, steam or water high pressures, the manufacturer guaranteeing it up to

Protector Woven Steel Covered Hose.

1000 pounds pressure to the square inch for garden hose. The spring steel covering is tightly braided upon the hose by special machinery, a point being made by the manufacturers that the thin metal strips thoroughly galvanized are closely woven with a snug, even pressure from every point, instead of being pulled over the hose, which, with round wires, sometimes cuts the outer covering. This method of protection gives an even outer surface, so that it can be drawn over lawns or such rough surfaces as in quarries, shipyards, boiler shops, &c., for a variety of purposes. They particularly recommend it for pneumatic tools and all uses demanding conduits capable of resisting continued pressures of great force. If the strips were deliberately cut at a given point the next meeting point of the strips would prevent any release unless every intersection was cut, which is a great advantage. It is extremely flexible and can be tied in a comparatively small knot without kinking. The ½ and ¾ inch hose for air or steam is guaranteed by the makers to stand an air or hydraulic pressure of 2000 pounds to the square inch. The 1-inch diameter will stand 1500 pounds to the square inch without bursting, it is said, these statements applying to four-ply hose. Three ply will stand 25 per cent. less and five-ply 20 per cent. more. This style of hose is made in ⅜, ½, ¾, 1. 1¼, 1½, 2, 2¼ and 2½ inch sizes, the company now building machines for weaving hose up to 5 inches diameter.

Bad Accounts.

A recent happening in a country hardware store, whose proprietor was temporarily absent, is a striking example of the unbusinesslike way in which credit is extended in some (it is hoped not many) stores. The circumstances were as follows:

An old man had made a purchase, and when the clerk handed him the wrapped parcel the customer leaned over the counter and said: "You will have to chalk it." "What is your name?" asked the clerk. "It's over there," said the old man, pointing to the ledger on the desk. "I am hard up now." Again the clerk inquired his name, to which a bystander replied "Jones." So the goods were charged to "Jones."

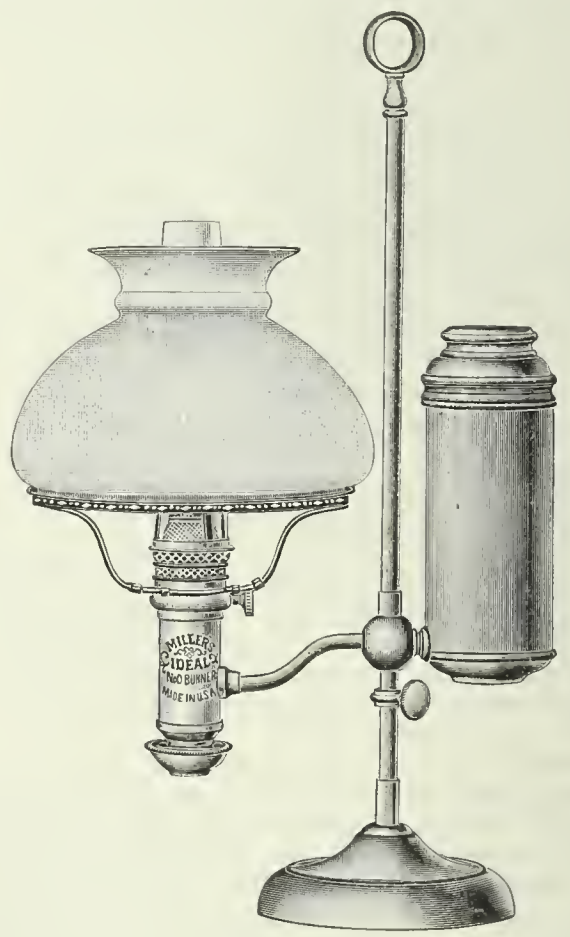
The old man was evidently unknown to the clerk; and, although the customer might have been like a "singed cat," "better than he looked," it was not a good basis for enlarging an account which the clerk knew nothing of.

He took the old man's word that he had an account, and he accepted the fact that the bystander knew the customer's name as a quasi guarantee that he was "all right."

It is obvious that this charge should not have been made without investigating the right the purchaser had to having the goods charged; and even if he was "all right," the charge should never have been made without ascertaining his initials or first name. Carelessness in these and similar regards is a fertile cause of bad accounts.

Miller Ideal Student Lamp.

Edward Miller & Co., Meriden, Conn., and 28-30 West Broadway, New York, have just put on the market the Miller Ideal student lamp, as here shown. The novelty of this lamp is in the greatly improved form of wicking device, by means of which a positive and even action is produced. The tubular wick, the burner being of the central draft order, is slipped into a cylinder of perforated brass, the inner gear wheel fitting into the perforations no matter how the cylinder is put in and lifting or depressing the wick so that a steady, uniform flame is obtained. The advantage of this lamp is that there is little heat, no shadow and oil always level with the



Miller Ideal Student Lamp..

burner, which insures a better illumination. They are made in three sizes, in both single and double styles, and they can be furnished in either brass or nickel plate.

The Eversole Iron Company, Ft. Wayne, Ind., are manufacturing a self heating Sad Iron which is a new invention and has just been placed on the market. This Sad Iron is operated by means of gasoline, the burner being placed in the center of the Iron just above the base, which is heated by the flames from the burner impinging on it. The company manufacture two sizes of Irons, one being intended for family use and the other for tailors.

Reflectors for Acetylene Lighting.

Acetylene having come so rapidly to the fore of late, every one in the trade can well afford to know something about it. Such knowledge is very likely to prove useful sooner or later. In this connection those interested in the subject will doubtless find the catalogue of lighting fixtures issued by I. P. Frink, 551 Pearl street, New York, a valuable help in their research after more light. The catalogue covers a very complete line of lighting fixtures for all purposes and for all classes of buildings, stores, show windows, churches, halls, &c., and the firm are always glad to supply any needed information not found within its covers. A very good sample of their work in the acetylene lighting line is shown in the Railway Station Building and the Machinery and Transportation Building at the Pan-American Exposition, Buffalo, where they have 32 of their reflectors in use in lighting these buildings. They give a splendid, even light, make a fine show, and have been very favorably commented upon both as to lighting capacity and appearance.

Stove and Hardware Dealers.

JOHNSON HARDWARE & IMPLEMENT COMPANY, Altus, O. T., have recently opened a branch store at Navajo. Their business is retail and the line handled covers Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, Harness, Wagons, &c.

J. B. GREEN has bought out the Hardware and Stove business formerly conducted by F. D. Gates at Oelwein, Iowa.

EVANS HARDWARE COMPANY, Statesville, N. C., have just been incorporated under the laws of that State, and will open up with a stock of Hardware, Stoves, Agricultural Implements, Paints, Oils, Varnishes, &c., on August 1. Mr. Evans is no longer connected with the Flanigan-Evans Hardware Company of Statesville, the style of which firm has been changed to J. P. Flanigan's Sons Company.

THE Hardware and Stove store conducted by W. H. Plank at 621 Kansas avenue, Kansas City, Kan., was destroyed by fire a short time since.

HEYMANN SUCESORES, Mazatlan, Sinaloa, Mexico, are intending soon to erect a new building for their Hardware business, and in connection therewith request from manufacturers catalogues relating to Store Ladders, Joist Hangers, Elevators, Metal Ceilings, Office and Store Furniture, Skylights, T Rails, Iron Railings, Iron Wire Office Guards, Windows, Doors, Blinds, &c. The firm would also be pleased to have information as to prices on the above so as to save time in ordering.

THE SMITH & EGGE COMPANY, Bridgeport, Conn., and 62 Reade street, New York, have just received from a customer in New Plymouth, Taranaki, New Zealand, a letter together with photographs and a copy of the local paper, which indicate the effectiveness of their Yankee Rat Trap during the bubonic scare. The catch of rats at one setting was 25, the previous night 11, with a total of 82 in one week.

THE SIMMONS HARDWARE COMPANY, St. Louis, Mo., have been incorporated with a capital stock of $4,500,000. The reincorporation was effected because the charter of the company had expired, and it is explained by one of the officers of the company to mean simply a transfer of old for new stock certificates. No change of any kind is entailed in connection with the company in consequence of this reincorporation.

A FIRE which occurred recently in the store of L. J. Cowles, St. Mary's, Kan., did a damage of some thousands of dollars to the stock of Stoves, Implements and other goods carried by Mr. Cowles. The loss is fully covered by insurance.

The International Correspondence Schools, Scranton, Pa., call attention to the fact that instruction is given throughout the entire year, the vacations of the principals and instructors being arranged so that there is no interruption in the work of the schools. This affords an opportunity for mechanics and others who have a dull season during the summer to take up a course by mail and make good use of what would otherwise be waste time.

NEW YORK TRADE SCHOOL CATALOGUE.

The great benefit derived by those who in the past have taken a course of instruction in the New York Trade School, at Sixty-seventh street and First avenue, New York, has made that institution popular throughout the United States, and there is no doubt that many young men who aspire to gain a mastery of some mechanical trade are already awaiting the appearance of the catalogue for the coming season. This publication has just been issued for 1901-1902, being the twenty-first school year. It consists of 44 pages and gives a list of the courses of instruction in the different trades, with half-tone engravings showing the different shops and examples of work done by the pupils.

The school was founded in 1881 by the late Col. Richard Tylden Auchmuty. Its purpose, as outlined in the catalogue, is to provide young men who have a bent for mechanics the opportunity of acquiring a knowledge of some trade that will be to its possessor the means of livelihood. The special advantage of the school is that whatever trade is selected, the pupils are in charge of competent instructors and assistants so that a thorough mastery of the handicraft may be gained by those who give their time and attention to the instruction received. In addition to teaching how to handle the tools and perform the manual labor of doing the work, lectures are given which thoroughly explain the principles governing the work. The pupils are also taught something of mechanical drawing and good business methods. Instruction is provided in both evening and day classes.

The evening classes for the twenty-first year open on October 14, 1901, and applications for entrance into these classes should be made before October 1. Those departments in which the readers of *The Metal Worker* are specially interested are the evening classes in plumbing, steam fitting and cornice work. Instruction in these subjects is given on Monday, Wednesday and Friday evenings from 7 to 9.30 o'clock. There are also day classes in each of these branches, those for plumbing and cornice work opening on December 9, 1901, while the steam fitting term begins January 6, 1902. Instruction in the day classes is given daily from 8.30 a.m. to 4 p.m., except on Saturday, when the school closes at noon.

A new class this year is an evening class devoted to wood pattern making. The instruction, in addition to teaching the use of the ordinary hand tools, will also include wood turning as relating to pattern making, and the course will embrace the making of pipe elbows, tees, core boxes, pulleys, propeller wheels, and various parts of machines. Drawing will be taught in connection with the practical work. Instruction will be given on woods and their grain as best adapted to pattern making, drying and seasoning materials, their weight and shrinkage, shrinkage of patterns and castings, making of cores and the material required, and varnishing patterns.

In addition to this instruction for young men, there will also be inaugurated a series of lectures for journeymen by A. A. Hamerschlag, on electrical work, and on steam engineering work. Each course will consist of ten lectures which are intended to provide information of value to a journeyman in practical work. The charge for a season ticket for either course is $1. A circular giving the subject and date of each lecture can be secured on application. Those who intend to take a course at the school this year should early secure a copy of the catalogue and place their application on file.

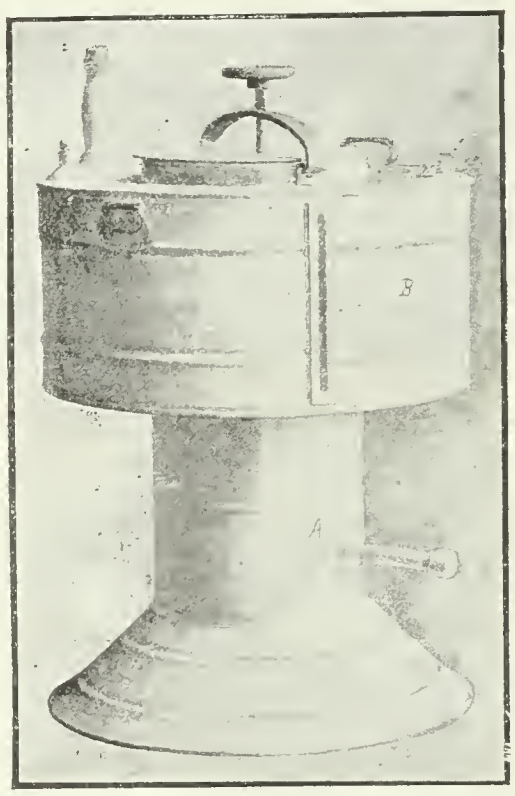
A course which has been notable for the excellence of the work of the pupils both in pattern cutting and in the articles made, is that devoted to cornice and skylight making. Last year the day class received much less patronage than such a valuable course of instruction should command.

ADVANCE IN RADIATION.

On Monday the steam and hot water heating trade received from the different manufacturers a new discount sheet on radiation. For some time back concessions in prices have been made on some styles of radiators by different manufacturers, and the natural tendency has been for the orders to concentrate on these lines. Recently an increase has been noted in the inquiries for prices on all kinds of heating goods, including boilers and radiators. This increase is evidence of a healthy condition of trade and a promising outlook. Those who have kept in touch with the movements in the trade have been of the opinion that it was only a matter of time when an advance in radiation would take place, and that it would occur as soon as any increase in the demand was shown. The present change in price amounts to an advance of 5 per cent. on some radiation and 2½ per cent. on other lines of radiation, and it has the final effect of putting all styles of radiation at the same price. Previous to the active demand mentioned there was some latitude in the selling prices, the complaint being made in certain quarters that some buyers were quoted prices out of proportion to their capaeity for consumption. It is expected that the new prices will be strictly adhered to.

The Hendler Portable Acetylene Generator.

The advantages derived from such a strong illuminant as acetylene gas, when the plant for its production is portable and available for use in wagons, railroad cars or in building operations, or for outdoor work of any character that must be done at night, will naturally create a demand for such an apparatus. The Hendler portable automatic acetylene gas generator, which has been designed for this purpose, is manufactured by the International Light & Heat Company of Kansas City,



The Hendler Portable Acetylene Generator.—Fig. 1.—General View.

Mo. A general view of the generator is presented in Fig. 1, and its construction and operation may be followed by a study of the sectional view presented in Fig. 2. It is claimed that the generator is entirely automatic in action, is without a gasometer, cock or valve, and stores no gas. The gas is produced as needed whether one or several burners are in operation.

The apparatus consists of a generating chamber, A, in which is the carbide cup F, the bottom of which is raised a short distance above the bottom of the chamber by means of legs. The chamber A is surrounded by a reservoir, B. The pipe C connects the generating chamber with the water reservoir. The carbide cup F has a number of small tubes passing through it. The outlet for the gas generated is by means of the pipe H, and a safety or blow off connection is made at K. The water reservoir is filled at the opening L, which is closed by a screw cap, making the reservoir perfectly tight. In operation the use of lump carbide is recommended as being more economical. When the carbide chamber has been charged and the water reservoir is filled it is only nec-

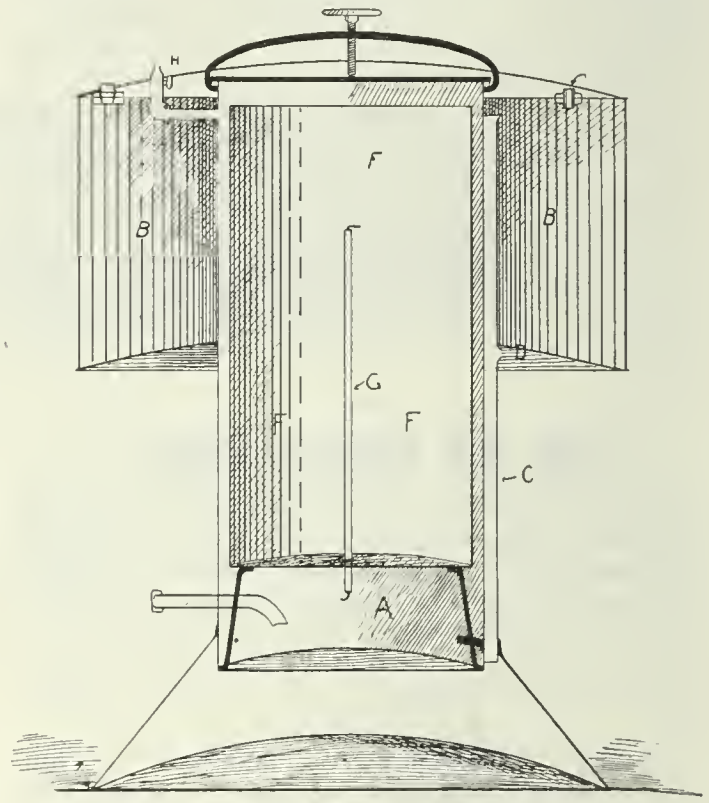


Fig. 2.—Sectional View of Generator.

essary to open the burner and allow the air in the apparatus to pass off, and when the apparatus is clear of air the gas presses to the burner and can be lighted. When the burner is turned out the gas pressure will force the water back from contact with the carbide and the generation will be stopped. As soon as the burner is opened and gas consumed the water will flow in again and cause more gas to be generated. If any excessive pressure occurs the gas will be forced up through the pipe C and escape through the blow off opening at K.

The operation being entirely automatic and being provided with a safety outlet, the apparatus is self regulating and well adapted for the variety of work for which it is recommended. It is claimed that the operation is not the least affected by jolting or jarring, or by the position in which it is set. These qualities adapt it for use in lighting railroad trains or locomotive headlights, also for wagons, carriages, outdoor building operations and any similar work. The generators are made in several sizes, adapted for supplying from 1 to 50 lights. The generators are said to be of first-class workmanship and made of the best materials, to be well adapted for general service and light enough to be readily transported. The machine capable of supplying 25 lights stands 24 inches in hight, is 24 inches in diameter and weighs but 34 pounds. It is pointed out that when the machine needs recharging it is a simple matter to unclamp the cap of the charging chamber, remove the feed cup F and thoroughly cleanse the interior.

The Metal Worker acknowledges the receipt of an invitation to attend the annual outing of the Brooklyn branch of the New York Association of Master Plumbers, to be held at Donnelly's Grove, College Point, on Wednesday, July 24. The steamer will leave the Bridge Dock, Fulton street, at 9 a.m. sharp. The invitation says that the outings in the past are numbered as bright days in the lives of the Brooklyn master plumbers. Those who desire tickets should correspond with Ed. Macdonald, 98 Cedar street, Brooklyn, N. Y.

SELLING ACETYLENE GENERATORS.

The popularity of the acetylene gas light not only has been established, but is extending. This is true to such an extent that it is now only necessary for men qualified to install such lighting plants to take up their sale in order to build up a profitable business. The period of introduction is well advanced and the burden of the labor incidental thereto has been borne largely by the mauufacturers, who protect the trade by allowing them a liberal margin of profit. In return for this the manufacturers have the right to expect the trade generally to join them in extending the sale of these goods, particnlarly as no great expense attends the making of an active canvass in this line. Here is an apparatus which has already made its way, and when those of the best quality are installed they not ouly bring a profit but have been almost universally satisfactory and the means of effecting other sales. All that is required to participate in these profits is for the plumber, tinsmith or other mechanic to do a little reading and studying in order to become thoroughly informed regarding the characteristics of carbide, and the best methods of generating acetylene gas from it. This will aid him in studying the different apparatus on the market, in order to select one to make a run with in his territory.

Inasmuch as there is a liberal profit in this trade manufacturers rightly hold that they are not asking too much of the trade which is naturally best qnalified to take hold of their goods in expecting them to make the necessary effort to qualify themselves to extend the sale of acetylene apparatus. The light, while powerful in illuminating qualities, is an agreeable one, and the apparatus which produces it is adapted for sale at all seasons. Those who are located in suburban districts are naturally customers for such a lighting apparatus, and there are instauces where tradesmen who have devoted their time to becoming experts in acetylene lighting have secured trade from quite a distance from their own town, and from lighting residences have installed illnminatiug plants in large hotels, and have eveu established systems of lighting for small towns.

The field is a wide one and it ouly needs to be handled with intelligence to build up an established trade on profitable lines. With the many modern conveniences adapted to the use of the well to do public, there is no reason why the progressive, active plumber, tinsmith or other tradesman should have any dull season. Acetylene lighting is a busiuess that can be pushed at all seasons, and one of its great advantages is that it is simple to understand, although a wide knowledge of its characteristics is one of the best aids to those who engage in the sale of the apparatus.

THE USE OF HEATING COILS.

Progressive men in various parts of the country have at different times informed *The Metal Worker* that they have built up a considerable business in the dull season, which nas grown into an established business for all seasons, by bringing to the attention of farmers and towns people the benefit that can be derived from a heating coil iu their stoves and heating apparatus. Where the smaller sizes of pipe are large enough for the work in hand, a good mechanic can make his own pipe coils, but where the larger sizes are used many have found it of advautage to send the exact dimensions of the pipe coil which they desire, or the chamber in which it is to fit, to the National Pipe Bending Company of New Haven, Conn. This company are prepared to furnish any kind of a coil, from the small coils that might be used in a cook stove for heating the kitchen boiler and the larger coil to be used in a hot air furnace for heating several radiators, up to the immense coils used in the vats of mannfacturing establishments. Recently a Canadian correspondent stated that he had done a considerable business in furnishing coils for cooking stoves and connecting them with tin, sheet iron and copper hot water tanks, raised on platforms conveniem to the stove. These furnished a large quantity of hot water available for domestic purposes and also for mixing feed and tempering the drinking water for stock. It is easy for the ingenious man to study out how he can serve well to do customers by explaining to them the convenience of pipe coils for heating water. By so doing he will frequently secure orders to fit np some kind of a pipe coil to meet special needs.

TESTS OF RADIATORS WITH SUPERHEATED STEAM.*

BY R. C. CARPENTER, ITHACA. N. Y.

In making a series of radiator tests during the spring of 1901 superheated steam was inadvertently used in several cases. To my surprise the capacity for heat transmission of the radiator was thereby reduced. I did not have sufficient time to investigate the pheuomena exhaustively, but the data which was taken seemed to be of such general interest that I have concluded to present the results of the test to the society for discussion.

The radiators tested were named respectively No. 1 and No. 2. No. 1 was 18 inches in hight and contained ten sections, each 11 inches wide, constructed so as to have very little air space between the sections, the least distance between sections being ¼ inch. No. 2 was 38 iuches in hight and contained ten sectious, each 7 inches wide, and spaced so as to give abundant room for air currents aronnd the sections. The least distance between sections was ¾ iuch. The radiators were both tested with steam which was taken through a single inlet, No. 1 being of the hot water type, with top connection as well as bottom conuection of the sections, whereas No. 2 was of the steam heating type, with no top connection of the sections. The dimensions are given in the accompanying table and the rough sketch shows general form of each radiator:

Dimensions of Radiators.

	No. 1.	No. 2.
Total hight, inches	18	38
Hight of leg, inches	2	3
Least distance between sections, inch	¼	¾
Total length, inches	24½	24
Thickness of radiator, inches	11	7
Type	Hot water.	Steam.
Number of inlets	1	1
Measured surface, square feet	38.6	49.1

The radiators were arranged for testing on a platform having an elevation about 2 feet above the floor, and sufficient for inserting vessels underneath the radiators to obtain the water of condensation. Steam for the test was obtained from a high pressure main which passed through a steam separator to remove any free water, thence through a reducing valve set to maintaiu the desired pressure, thence to a receiver located between the two radiators. From the receiver a pipe was led to each inlet of the radiator. The water of condensation was taken off at the inlet end and permitted to drip into a receiver provided with a water glass arranged in such a manner that the water in the receiver could be held at a uniform level, which was about 1 foot below the bottom of the radiator. The water of condensation was cooled before being weighed. Temperatures were taken of the outside air and at several places in the air of the compartmeut in which the test was conducted. Temperatures were also taken of condensed steam and of the surface of the radiator on two sides. In taking the temperature of the surface of the radiator the bulb of a thermometer was fastened against the metallic wall of the radiator and protected from external radiation by hair felt. This test does not give the temperature of the radiator because of the cooling of the thermometer bulb, but it gave useful information as to the distribution of heat in the radiator. The two radiators tested were kept at a distance of about 6 feet, and the effect of radiation from one to the other was counteracted by a partition midway between the two. The radiators were shielded from any currents of air and the room was kept, as nearly as the outside conditions would permit, at a temperature of 70 degrees.

The writer has observed in previous tests of radiators that when testing a high and a low radiator the low radiator would always show a greater heat transmission for the same surface exposed. In these tests we have an apparent exception to this rule, as it will be noted that the higher radiator gave a higher rate of heat transmission per square foot of surface than the lower. An examination, however, of the dimensions of the radiators will show that the air space surrounding the sections in the low radiator was very much less than in the high. While I have not an accurate measurement of air space, it is probable that the air space per unit of surface in the low was about four times that in the high radiator.

*Paper read at fourth semiannual meeting of the American Society of Heating and Ventilating Engineers, at Chicago, July 13, 1901.

The test is interesting as showiug that by properly proportioning the air spaces betweeu the sections the heat transmitted per unit of surface in high or low radiators may be equalized. This also shows that the air spaee doubtless plays an important office in earrying away the heat from the radiators.

Expressing the final results in terms of the number of heat units transmitted per hour per square foot per degree, we have the following results, as applicable to the case where there was either no superheating of the steam or only a very slight amount:

Steam pressure. Pounds.	Superheat. Degrees.	B. T. U. per square foot per hour per degree. Radiator No. 1.	Radiator No. 2.
2	0.0	1.48	1.83
2	0.13	1.50	1.92
10	0.30	1.50	1.91

These results indieate a substantial uniformity in heat transmission per degree difference of temperature from 2 to 10 pounds.

The process of redueing the pressure wire drawed the steam, thus liberating a eousiderable amount of heat energy, whieh expended itself in superheating the steam. The effeet of liberating this heat energy without work was to superheat the steam, and this, eontrary to our expeetations, was to reduee the amount of heat transmitted. Thus with radiator No. 1, with no superheat, the heat transmission per hour per square foot of surfaee per degree, which we will term hereafter the heat transmission, was 1.48 B. T. U; with about 36 degrees superheat this was reduced to 1.16 B. T. U. With radiator No. 2 there was a corresponding reduetion from 1.83 to 1.41 B. T. U.

With 5 pounds of steam pressure, and when steam was superheated 13.1 degrees, the heat transmissiou was 1.41 B. T. U. for the low radiator and 1.74 B. T. U. for the high. When the degree of superheat was inereased to 24.1 degrees the heat transmission of the low radiator fell to 1.23 B. T. U. and that of the high to 1.45 B. T. U.

With 10 pounds of steam pressure the heat transmission for 3-10 degree of superheat was for the low radiator 1.5 B. T. U. and for the high radiator 1.9 B. T. U. When the steam was superheated to 26.7 degrees the heat transmission fell to 1.24 for the low radiator and 1.62 for the high radiator. Several cheek runs were made, the results of which show a variation of less than 2 per cent. This run is given uncorreeted, although the results are probably 2 or 3 per eent. high because of some condition which could not be determined. Possibly the radiator may have been iu a slight draft of air, although measures were taken to prevent sueh an oeeurrenee if possible.

The conelusions from the tests made with superheated steam would be that it is a poor medium to employ for heating purposes, the reason doubtless being due to the fact that superheated steam is much more nearly like a perfeet gas in its nature than a saturated vapor, and when in this eondition parts with its heat mueh less readily than saturated or wet steam. It is not probable that the amount of superheat was suffieient in any of the cases described to fill the entire radiator with steam of this charaeter, and this, I take it, aceounts for the continued falling off in heat trausmission as the degree of superheat increased.

The results whieh are obtaiued relating to the effeet of superheated steam were quite aecidental and unexpected, and are, I believe, so peeuliar in effeet as to warrant general discussion.

The following table gives the general results of the radiator tests, which is followed with eomplete tables of data and results:

GENERAL RESULTS OF RADIATOR TESTS.

Radiator No. 1.

Connecticut Plumbers' Committees.

President Manwaring of the Connecticut Association of Master Plumbers has appointed the following committees for 1901-2:

Sanitary Committee: S. E. Dibble, New Haven; T. W. Corbett, New Haven; T. D. Barlow, Waterbury; J. F. Brady, Bridgeport; George Mahl, Hartford.

Legislative Committee: James Donovan, Middletown; J. R. Fay, Southington; T. H. Langdon, Hartford; J. M. Page, Naugatuck; H. Marsden, Derby.

Essay Committee: F. H. Hitchcock, Woodbury; A. H. McMahon, New Milford; James Ahern, Hartford; John Troland, Norwich; George Scofield, Bridgeport.

Apprenticeship Committee: L. H. Mills, Bridgeport; J. S. Craig, Hartford; T. E. Burnes, New Britain; A. J. Clerkin, New Haven; O. D. Sykes, Seymour.

New York City Notes.

The plumbing department of the Board of Education under Chief Inspector Delvar is very busy now on vacation repairs. Work is to be done on nearly every school in the city.

* * *

Trade is picking up and there are but few journeymen out of a job. Among the new jobs under way are the following:

Gus Staats, at northeast corner 130th street and Lenox avenue, four large apartment houses.

L. D. Hosford, at 320 West Twenty-fifth street, an elevator apartment 40 x 98, and the Y. M. C. A. Building at 153 East Eighty-sixth street.

Rossman & Bracken have an apartment at 213 West Sixty-second street.

Reynolds & McMahon have a row of flats on 115th street, west of Fifth avenue, and an apartment at 141st street and Seventh avenue.

L. H. Wenzel has a large private house, 40 x 85, on Eighty-seventh street just east of Fifth avenue.

Paul Enell has a block of flats at 125th and Manhattan streets and a row on Amsterdam avenue between 141st and 142d streets.

Milton Schnaier & Co. have, in addition to their other work, an apartment at 120 East Thirty-first street.

J. P. Knight is plumbing a large bachelor apartment on West Forty-fourth street, which will be used in connection with the clubs in that vicinity.

* * *

Work on several new schools has been given out lately and the plumbing is being done by the following:

One Hundred and Sixteenth and 117th streets, between Lenox and Fifth avenues, J. J. McGrath.

Eighth and Ninth streets, near Avenue C, D. J. Deady.

John Spence has the addition to the schol at 167th and Baretto streets, in the Bronx.

James Fay has schools at Forty and Forty-first streets and Fourth avenue, in Brooklyn, and 101st and 102d streets and Amsterdam avenue, in Manhattan.

* * *

In proportion to area there is more building being done in the district east of Broadway, south of Fourteenth street and above Chatham square than in any other portion of the city, and with all the new work plumbers in that section are very busy.

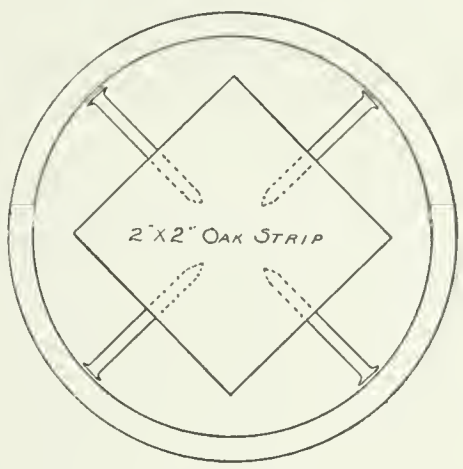
A NEW building has replaced the machine shop of the American Radiator Company, Detroit, Mich., which was destroyed by fire some time since. This new building or addition to the plant has been adapted for a much larger scale of usefulness, being more conveniently arranged than the old one and better equipped in every particular. This will enable the company to furnish their popular line of Radiators with their usual promptness. They are to be congratulated on the possession so early in the season of the increased facilities thus secured, as they will be enabled to avoid many delays that could not have been otherwise than disappointing to the trade.

VOLUME OF WATER IN HOT WATER HEATING APPARATUS.*

BY W. M. MACKAY, NEW YORK.

The volume of water required per square foot of radiating and heating surface in the radiators, mains and heater in a hot water heating apparatus, for best results in heating and greatest economy of fuel in operation, is a question which has received some attention in the past, but judging from the differences of opinion, as expressed in their various constructions by manufacturers of heaters which have been used for heating by hot water during the past 25 years, and which are being offered and used at the present time for that purpose, we are still far from a standard, particularly in the volume of water required in the heater per square foot of heating surface exposed to the fire or heated gases. In the manufacture of radiators, particularly when they have been constructed with a view to their being used for hot water heating, the standard aimed at, and finally accepted, by the leading manufacturers of radiators in this country has been 1 pint of water to the square foot of surface—being approximately the volume of water contained in 1 square foot of surface of 1 inch ordinary thickness wrought iron or steel pipe.

Some radiators have been constructed which contained less than this volume of water, and some which contained considerably more, but in either case these



Volume of Water in Hot Water Heating Apparatus.

radiators have gradually gone out of use, while new designs in hot water radiators which have been brought out during the past six years have largely conformed with this standard, which seems in practice to be the best suited for this purpose for all classes of buildings, except, perhaps, all glass constructions. I have found it to be an advantage, on account of the greater and quicker cooling effect in such constructions and the variable temperatures at which the water in the system is sometimes maintained on account of irregular firing, lack of fire box capacity or lack of capacity in the heater, and on account of friction due to the long lines of piping usually employed in placing the required radiating surface in this class of building, to use a surface that contained from 50 to 100 per cent. more water, although were a uniform temperature maintained on the water in the heater and the same arrangement of radiating surface utilized that is at present used for the heating of other buildings with this system, with short circulations and an ample arrangement of mains, it would not be necessary to increase the body of water in the radiating surface in such constructions above 1 pint to the square foot of surface.

At our last annual meeting, during a topical discussion when this question was under consideration, I mentioned an experiment, or test, made some years ago in two greenhouses of uniform construction, size 16 x 100; each house contained approximately 2000 square feet of glass and had about 650 square feet of surface or running feet of 4-inch greenhouse pipe; each house was heated by a separate heater located in the same pit, with separate brick flues 8 x 12 inches extending 20 feet above the ground. To these flues each heater was separately connected by 10-inch wrought iron pipe; each heater had about 4 square feet of grate area and about 90 square feet of fire and flue surface (about half fire and half flue surface). The radiating surface was arranged in the usual way for such constructions, in 4-inch greenhouse pipe on each side of the house below the benches, with one flow and two return pipes on each side, an open expansion tank at the extreme end of each line, and each

* Paper read at the fourth semiannual meeting of the American Society of Heating and Ventilating Engineers, Chicago, July 13, 1901.

side connected separately to the heater with a 4-inch flow and return connection. In one house the 4-inch pipe was left regular and had an internal area of about 10 square inches; in the other house 2 x 2 inch oak strips were inserted in the center of the pipes, reducing the waterway about 40 per cent., while retaining the same external surface. In a six-hour test, maintaining a 60-degree temperature in each house with an outside temperature of from 25 to 30 degrees, an average temperature of 160 degrees was maintained on the flow mains and 130 degrees on the return mains at each heater. The consumption of fuel was 130 pounds of anthracite coal, stove size, for the house with full waterways in the radiating surface, and 110 pounds of the same coal for the house with reduced waterways, while the temperature on the flow main on the heater with reduced waterways was frequently 5 degrees higher than on the other heater, and the dampers on this heater had to be partially closed to prevent a higher temperature. Later this house was lengthened 25 feet, or 25 per cent., and piped in the same way, and the temperature maintained with the same average consumption of fuel as that used in the other heater on 25 per cent. less surface and glass area.

Since that time I have used largely 1¼-inch pipe, with a little over 1 pint of water to the square foot of surface, in small conservatories; 1½-inch pipe, with about 1½ pints of water to the square foot of surface, in medium sized conservatories, and 2-inch pipe, with about 1 quart of water to the square foot of surface, in large conservatories and greenhouses, in preference to 4-inch greenhouse pipe, with about ½ gallon of water to the square foot of surface, and have found that I obtained better and quicker results, a greater possible variation of temperature and greater economy, from the use of 2-inch pipe with manifolds than from any other size of pipe, either larger or smaller.

In arranging the mains of a hot water heating apparatus the area of the main has to be determined from the number of square feet of radiating surface to be supplied, and the nature of the surface, whether direct, direct-indirect or indirect radiation, and from the length of the main, also whether the main is to be used as radiating surface or covered; so that no standard as to volume of water per square foot of surface supplied could be adopted in regard to the mains in a hot water heating apparatus without being subject to considerable variation. At the same time I have found cases in hot water heating where the areas of the mains were from 25 to 50 per cent. larger than was necessary, and they could have been reduced with beneficial results, being made large to insure a uniform temperature in the main, which could have been obtained in a smaller main with a different arrangement of taking off branch connections.

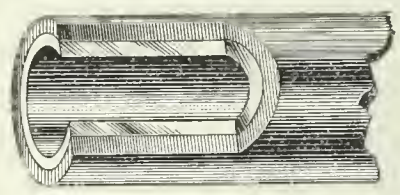
The greatest difference of opinion as to the volume of water required per square foot of its surface in hot water heating seems to exist in the heater or source of supply.

Commencing with boilers of the Cornish type, which are used in some sections for hot water heating, they contain about 3 gallons of water per square foot of boiler surface; then the ordinary horizontal and vertical tubular boilers arranged for hot water have about 1½ gallons of water per square foot of surface; a number of cast iron one piece and sectional heaters have about 1 gallon of water per square foot of surface, some have 3 quarts and others have ½ gallon; then some heaters of this type and water tube heaters contain from 3 pints to 1 pint of water per square foot of surface, and in some heaters constructed of 1-inch pipe, while the volume of water to the foot of surface is not materially reduced, the friction is increased by inserting a sheet metal circulating division, reducing the pipe to half its area. Now, if we do not consider the Cornish boilers, which are more largely used in other countries, and commence with the horizontal tubular boiler, which is largely used in this country, we have a variation in hot water heaters of all the way from 1½ gallons to 1 pint of water per square foot of surface, and while all of these different constructions, with their varying amounts of water, will accomplish certain results with more or less efficiency and economy, certainly some will produce better results than others, and on that account would be considered a proper standard, and while the arrangement and location of the surface to the fire and heated gases would make some difference as to the volume of water which should be back of it, I have obtained the best results from an average of ½ gallon of water per square foot of heating surface in a hot water heater, with an average of from 20 to 25 square feet of heater surface to each square foot of grate area, the surface being arranged about 50 to 60 per cent. of fire surface and about 40 to 50 per cent. of flue surface.

THE town of Camden, Maine, wishes to receive plumbing and heating estimates for the local school house.

Tin Lined and Lead Lined Iron Pipe.

Lamb & Ritchie, Cambridgeport, Mass., are offering tin lined iron pipe, as shown in the accompanying illustration. The L. & R. pipe, as it is called by the manufacturers, is made by pouring melted tin into wrought iron pipe. While melted the tin, it is explained, is inseparably united and formed into a substantial inner pipe, resulting in one solid pipe of two metals which cannot be torn apart. Lead lined pipe is made in the same way. The lining, it is remarked, cannot be separated from the iron even when bent or coiled. The composite pipe is designed to be successfully used where tin, lead, brass or iron pipes alone are too expensive or unsatisfactory. It is pointed out that the tin lined pipe insures pure water and that it combines with this merit all the strength of wrought iron pipe, and actually increases its strength. It is shown that it is essentially different from iron pipe dipped in tin, or iron pipe lined with a separate tin pipe which will become detached. Fittings are lined with tin to match the pipe. It is stated



Tin Lined Iron Pipe.

that hot water will not injure the pipe, that rats will not gnaw it and that thieves will not cut it out. For ornamental finish the pipe may be nickel plated.

Heating and Plumbing Notes.

A 61-PAGE CATALOGUE, illustrated with half-tone engravings showing a fine line of Gas Fixtures, and known as Catalogue No. 9, is being distributed among the plumbing and gas fitting trade by Charles Polacheck & Brother of Milwaukee, Wis. The firm quote prices on the goods which are said to be very attractive.

THE Pittsburgh *Dispatch* is responsible for the report that a novelty in the way of Glass Bathtubs is to be put on the market by a company in which Uniontown, Pa., capitalists are interested. It is stated that a $50,000 factory for manufacturing these tubs is to be erected at Port Marion, Pa. Danger of breakages from changes of temperature are said to be avoided by running the pipes so that the water heats the Tub before it enters.

THE SMOKE PREVENTION COMPANY OF AMERICA, 66 Broadway, New York, are distributing a very suggestive card, inviting close attention to the boiler room, to see if the use of their Automatic Smoke Preventor and Fuel Economizer would not effect some economy. A feature of the card is a picture showing the back of a large chair in front of an open fire place, with the heads of the young man and his sweetheart just appearing above the chair.

THE WILLIAM GROSCUP COMPANY, Baltimore, Md., report some large contracts in hand, among which are a low steam pressure system for the C. & P. Exchange Building, a new Boiler for the department store of H. Wessel & Son, a hot water system for the *café* and residence of George Reuss, and steam systems for the residence of James R. Brewer and the office of John Waters, all in Baltimore. The firm are installing a hot water heating plant in the residence and pharmacy of H. F. Vogal, and doing the hot water heating and plumbing in the office of Samuel Rice. They have also a contract for plumbing seven houses for James F. Carter, and one for the sheet metal work, plumbing, gas fitting and range work in 21 houses for T. Milton Jones.

E. RUTZLER, 171 Centre street, New York City, has the contract for equipping the State Hospital at Central Islip, N. Y., with a heating plant. He is using 24 Toby Water Heaters in the different buildings. These Water Heaters are made by the J. L. Mott Iron Works of New York City.

The master plumbers of Scranton and Wilkes-Barre, Pa., are enjoying a joint outing at Ranson, Pa., to-day.

The Board of Education of Elmira, N. Y., will receive bids until July 27 for a fan system of heating and ventilation and for plumbing the addition to the School Building No. 4 in that city.

The Abner Acetylene Gas Company, 34-36 La Salle street, Chicago, Ill., are sending to the trade an eight-page circular devoted to their Abner Acetylene Gas Generators for lighting residences, stores and all kinds of buildings, including large hotels. The Generators vary in capacity for furnishing from 10 to 2000 lights.

The Paragon Brass Works, 87 Centre street, New York City, are sending to the trade a six-page folder devoted to their Overhead Vehicle Washers and Water Cut Offs for use in hose. This will be of interest to plumbers who desire to fit up stables for customers or liverymen where appliances are desired for conveniently washing carriages.

Superintendent of Buildings Gray of Cambridge, Mass., has awarded a contract for $15,200 to Lynch & Woodward of that city for furnishing a new heating and ventilating system, and also new Boilers, in the Rindge Manual Training School.

The Central Foundry Company of New York, a New Jersey corporation, will hold their annual meeting in Jersey City on July 25.

The Bridgeport Artesian Well Company, Bridgeport, Conn., have started work on a well for Charles A. Armstrong. They have also resumed work on the well which they are sinking for the Locomobile Company, which is now down to a depth of 300 feet.

Bids will be received until August 9 by A. F. Bickham, constructing quartermaster, 419 North Washington street, Alexandria, Va., for installing the plumbing and steam heating apparatus in two sets of officers' quarters at Fort Washington, Md.

Cramer & Hollister, Cortland, N. Y., bid $1757 and secured the contract for plumbing and heating the Pomeroy Street School Building in that town.

George C. Crawford & Co. have opened a new plumbing shop and showroom at Northeast Harbor, Maine.

J. C. Polson, Holyoke, Mass., has the plumbing contract for a 35-tenement block for L. A. Lafrance, in that city. He also has a contract for plumbing a 12-tenement, a 15-tenement and a 48-tenement building for the same owner.

The contract for plumbing the new Mutual Life Building at Little Rock, Ark., has been awarded to Pettit & Sanders of that city, and also the contract for a steam heating system in the Central Baptist College at Conway.

The High School of East Hartford, Conn., of which H. B. Williams is chairman, will receive bids for installing a new plumbing system in the High School Building.

Simpson Clark, Springfield, Mass., has a contract for placing two Hot Air Furnaces in the Congregational Church in West Springfield. He is also installing a Magee Steam Boiler in the residence of Dr. Atwater and placing a steam heating apparatus in the State Street Baptist Church.

David W. Yarborough, Atlanta, Ga., has the plumbing contract for the Piedmont Hotel in that city. Among the items are 150 Porcelain Bathtubs.

Libby & Blinn, Hartford, Conn., have been awarded an important contract for heating and ventilating the Eliza Trumbull Robinson Memorial Ward, which is being erected in connection with the Hartford Hospital. The apparatus will consist of both direct and indirect steam radiation. The ventilation will be arranged so as to be operated mechanically by a fan or by gravity, as may be desired.

J. B. Mooney & Co., Grand Forks, N. D., bid $3385 and secured the contract for the steam heating and ventilating plant for the East Grand Forks High School. The firm also have contracts for a steam heating plant for the residence of J. Gowran and for a hot water heating plant for the residence of M. McGowan. They are installing the plumbing in the residence of C. Vallely, and are constructing sewer systems for James K. Swan and J. J. Dunlap.

New Departure Bell Company, Bristol, Conn., for whom John H. Graham & Co., 113 Chambers street, New York, are sole representatives, have just put on the market a full line of Brass Compression Bibs. The particular attention of the trade is asked to the fine finish and high grade of the product. They are booking orders for Racking Cocks, which they expect to be able to ship by August 1, and will have lines of Liquor Cocks and similar goods, it is said, by September 1 next.

The Western Tube Company, Kewanee, Ill., have just issued a handsome illustrated and descriptive catalogue of their goods containing 204 pages, well printed on fine paper. In it are shown goods manufactured by them, among which are full lines of Wrought Iron and Steel Pipe for steam, gas, water and air, Cast Iron and Malleable Iron Fittings, Brass Fittings, Brass and Iron Valves and Cocks and Radiators and Coils for steam and hot water, also square and rectangular Tubing for agricultural implements and agricultural purposes.

The plumbing firm of William B. Bull & Son of Lenox, Mass., have begun what is said to be the biggest contract of plumbing that was ever let in the State, outside of Boston. The contracts call for the plumbing of the Hotel Aspinwall, the setting up of 106 bathtubs and 138 closets.

Bids will be received until July 27 by the Board of Education of Rochester, N. Y., for plumbing and gas fitting the East High School in that city.

The action of the Mayor, says the *News* of Savannah, Ga., in sustaining the plumbing inspector in ordering to be opened for examination plumbing work that had not been inspected will be sustained by public sentiment. It is of the utmost importance to the health of householders and the community that the plumbing that is being put in in connection with the new house drainage system shall be perfect. Defective plumbing in a house means danger of sickness and death to those who live in it. To permit poor plumbing, or an opportunity for defective plumbing, after going to the expense of providing an elaborate and costly system of drainage for the especial purpose of improving the health conditions, would be the worst kind of folly. As a matter of protection to those who live in the houses, those who pay for the plumbing and the plumbers themselves, all of the plumbing ought to be inspected.

The Trenton Potteries Company of Trenton, N. J., are erecting three additional kilns in their Ideal plant. These kilns are to be used in the manufacture of Solid Porcelain Bathtubs and Wash Tubs. The demand for this class of Earthenware is so great that at the present time all of the manufacturers are months behind with their orders. There is no such thing as producing any goods in this line in either the A or the B quality and securing prompt shipments upon it. As the demand for this class of ware is increasing, the Trenton Potteries Company decided that the only way they can catch up with their orders is to increase their producing capacity to double its present dimensions. It is expected that the kilns will be ready within six weeks, and at the end of that time the company will be in a position to make much better shipments than they have been able to make for the past four or five months.

Francis Brothers & Jellett, Philadelphia, have a number of large and important contracts on hand, among which are a mechanical plant, including high pressure water tube boilers, for the store of J. R. Jones, to cost $6500; a similar plant for the Philadelphia Warehouse Company, including two return flue tubular boilers, to cost $26,000; a small plant for the Merchants' Warehouse Company, to cost $11,500, and a plant for an addition to the building of H. K. Mulford & Co., to cost $9500. They also have a contract for a low pressure hot water heating system for the residence of David P. Lee, to cost $1200.

New Firms and Changes.

JOHN HANLEY has opened a plumbing shop at the corner of State and Hawley streets, Binghamton, N. Y.

S. G. BOUIS has opened a plumbing establishment at Macon, Ga., with a complete new stock.

THE AUTOMATIC HEATING COMPANY of New York City have been incorporated with a capital of $3,000,000 by George F. Roberts, Lewis L. Bowker and C. F. Walker to manufacture and deal in appliances for generating heat.

THE AMERICAN SAFETY GAS BURNER COMPANY of Providence, R. I., have been incorporated with a capital of $100,000 by George L. Palmer, Stephen E. Patenaude, Thomas F. Toomey, Calvin Deane, Martin V. Brady, John M. Fraser, Andrew H. Moffitt.

THE INTERNATIONAL DUST & CINDER DEFLECTOR COMPANY have filed articles of incorporation in the County Clerk's Office in Brooklyn, N. Y. This company purpose to manufacture patent machinery to provide better air in cars, vehicles and houses and to shield or deflect cinders from doors, windows and ventilators. The capital stock is $175,000. The incorporators are Charles P. Buchanan, Alexander F. Critchon, Charles A. Withers, Jacob A. Cantor and William A. Brockel.

THE GILMORE & DAVIS COMPANY, Tallahassee, Fla., inform us that they are going into the plumbing business and desire to secure catalogues and quotations from manufacturers of goods in their line.

THE NEW CENTURY GAS FIXTURE MFG. & ART METAL COMPANY, with principal office at 1145 South Fourth street, Camden, N. J., have been incorporated by Albert Musser, Frederick Forster and Charles S. Ackley to manufacture Gas and Electric Fixtures. The capital of the concern is $100,000.

THE SANITARY ENAMELING COMPANY, Layton Park, near Milwaukee, Wis., who completed their enameling plant last November, have decided to build a foundry to be 85 x 250 feet. It is to be ready in two months, and the company will manufacture in it Bathtubs, Lavatory Sinks and other Plumbers' Supplies which require enameling. The following officers have been elected: President, R. G. Hayssen; vice-president, H. Hayssen; secretary and treasurer; A. Hayssen.

The Uses of Cement.

While there are many kinds of cement the readers of *The Metal Worker* are most interested in those which can be used in the stove, steam fitting, plumbing and roofing trades. Although it is the object of the pipe fitter, wherever possible, to make a tight joint without the use of any material for making it up, the best mechanic recognizes the value of some lubricating and hardening material on the threads of the pipe. This is not so much for the purpose of making the joint tight as for preserving the surfaces in contact and aiding in separating them in case it is necessary to take the pipes down. In many instances, however, a defective thread, a flaw in the fitting or on the face of a flange joint is prevented from causing annoyance by the use of a suitable cement. George Callahan & Co., 218 Front street, New York, who have made a specialty of this branch of business for a number of years, offer to the trade a variety of cements adapted for different purposes. Their Old Reliable steam joint cement is furnished in the form of a dry powder in packages of different sizes. It is easily mixed in sufficient quantities for use by the addition of pure boiled linseed oil, and they claim that it not only makes tight joints, but joints that are easily separated, leaving the threads clean and rustless. The manufacturers point out an instance where their cement has stood a pressure of 300 pounds on an 18-inch flange for a period of seven years.

Another of their cements is adapted for the use of roofers, and is suited for work on both slate and metal roofs. Frequently a roofer is called to repair a leak when the roof is still wet. In such a case, the company state, their rubber roof cement is a desirable aid, as it will stick to a wet roof, making it tight until more substantial repairs can be made. Moreover, the cement is claimed to be well adapted for standing the weather, keeping the roof tight indefinitely, if not broken by rough treatment. The firm also make a special paint for use on roofs. Another kind of cement they furnish is adapted for filling the joints in stoves, and a special fireproof cement is made for hot air furnace work. They also have a fire clay suitable for lining fire chambers. Circulars pointing out the features of merit of these various specialties can be secured on application.

The Baron De Hirsch Trade School.

Seventy graduates received their diplomas at the closing exercises of the Baron de Hirsch Trade School, 222 East Sixty-fourth street, New York City, on the evening of Thursday, July 12. A feature of the exercises was an interesting display of the work of the classes during the past season. These included examples of house painting, sign painting, plumbing, carpentry, electricity, drawing, and machinists' work. The plumbing exhibit contained, among other things, a complete modern shower and needle bath, with all the necessary piping, a number of models of pipe joints, and creditable samples of different kinds of plumbing work. The plumbing class during the past season was the largest, numbering 21 members. Emil Klamper was awarded a special prize for excellence in this department.

In the course of the exercises, A. S. Solomons, general agent of the Baron de Hirsch Fund, announced that many members of the graduating class of the trade school had already been promised remunerative positions. In commenting upon the usefulness of the institution, Mr. Solomons said that some of its graduates are now being paid salaries of as much as $27 per week, while many of them were receiving from $15 to $18 per week. When it is understood that the membership of this trade school is comprised largely of young Hebrews who have recently landed in this country, and who are in many cases unable to speak the English language, the fact that they are turned out, after a six months' course of trade instruction, sufficiently well equipped to earn a good living at their chosen trade, is certainly to the credit of the institution. Besides hearing from Mr. Solomons the graduates were addressed by the Reverend Harris Maslinsky and Superintendent J. Ernest G. Yalden.

Brazing Brass to Copper.

The best solder for uniting brass to copper, says the *Tradesman*, is soft brass, which will melt much easier than the brass which is to be joined to the copper, otherwise the work would melt at the same time as the solder. The edge of the work must be carefully cleaned, and then the parts brought together in their proper place, and secured with iron wire. The flux to be used is borax, rubbed up in water until it is like a fine cream. The solder, which may be in the form of beads, strips or wire, is next distributed along the joint. The amount of heat and the method of applying it depend entirely upon the size of the work to be done. If the work is small, the blow pipe is by far the most convenient and safest, because if the heat is too great there is danger that the brass part of the work will be melted. The heat is to be applied until the solder melts. As soon as the solder melts or flushes, the work should be struck, so as to jar it just enough to make the solder flow into the joint. To find out whether the solder is soft enough for the work, a piece may be laid upon a bit of brass of the same kind as that of which the work is made, and put into the fire. If the solder melts considerably sooner than the brass it will be safe to use it for the work. If, on the other hand, they both melt about the same time, a softer solder will be needed. Spelter solder may also be used for the purpose.

A scheme is on foot to consolidate a large number of manufacturers of malleable iron castings. It is stated that the consolidation is planned to include practically all the malleable concerns in the West and some in the East.

THE TIN HOUSE WAGE SCALE.

The following statement of the changes in the tin house wage as agreed upon by the American Tin Plate Company and the Tin Plate Workers' International Protective Association, and which went into effect Monday, July 15, was given out by the officials of the association:

Tinners working on "jumbo" stacks have received an advance by the changing in the classification of large and small plates. They also received an advance of prices amounting to 3 per cent. on large plates, 10 per cent. on small plates, and in some instances where men work on stacks by day rate the day rate was advauced from $2.25 per day to $2.75 per day. On double and single machines an advance was given to the amount of about 3 per cent. on large and 10 per cent. on small plates. The classification of plates in these stocks was changed, which will give the men a further advance of about 5 per cent. On the ten-roll Banfield, Thomas and White machine an inequality had existed that worked hardship on the men, which was remedied this year by the company granting an advance of 20 per cent.

Assorters under the existing rates making less than $1.25 per day will receive an advance of 5 per cent. Reckoners receiving less than $1.15 will receive an advance of 5 per cent. Boxers and pickers receiving less than $1.75 will receive an advance of 5 per cent.; scruffmen will receive 10 per cent. advance in Elwood and Anderson works. Plate wheelers receiving less than $2 will receive an advance of 5 per ceut. All other laborers in and around the tin house earning less than $1.45 per day will receive 5 per cent. advance. The reason given by the company for not giving a general advauce to this class of labor was that some iuequalities existed in the rates and it was their idea to put the rates on a more equitable basis.

The gain in the opening department was a matter of gain in couditions rather than in wages. In the past it has not been the custom for the company to handle the iron before being opened. By the settlement reached the company now agree to handle the iron both before and after being opened. In view of the fact that this is a reduction in the amount of the work performed by the openers it is therefore practically an advance in wages.

The difficulty in obtaining an advance in this department is produced by the differential in wages existing between the Eastern and Westeru mills and also the fact that in the Eastern mills boys and women are employed to do the work, the company contending that if any difference, the work of boys and women is more satisfactory. The wage rate for opening plates in the Western mills is at present from 15 to 25 per cent. higher than in the Eastern mills.

PROPOSED CHICAGO TIN PLATE AND CAN COMPANY.

The fact became known during the past week that a number of Western tin plate consumers, including packing and canning interests in Chicago, have been working on a plan to secure an indopendent supply of tin plates and cans. It is proposed to organize a company under the name of the Chicago Tin Plate & Can Company, with a capital of $2,500,000, for the purpose of putting up tin plate and can making factories, of which $1,000,000 is to be 7 per cent. cumulative preferred and $1,500,000 common. It had not been intended by the promoters of this scheme that it should become public at this time, but in some way a confidential circular fell into the hands of a representative of a daily paper. The projectors of the company are unwilling to disclose any more of their plans for publication, but it is stated that the scheme contemplates the erectlon of a complete steel plant, a blooming mill and a sheet bar mill, as well as a 12-mill tin plate plant, with a capacity of about 450,000 boxes annually. The tin can department will adjoin the tin plate plant and be equipped with machinery for turning out 750,000 cans a day, and it is said that the company own valuable patents covering machinery for the manufacture of cans. It is understood that the scheme is backed by practical men who have been connected with both the manufacture of tin plate and cans. Enough is known of the project and its backers to cause considerable confidence to bo placed in its becoming a reality.

The Bostwick Steel Lath Company, Niles, Ohio, have decreased their capital stock from $100,000 to $40,000.

THE CARNAHAN STAMPING & CAN COMPANY.

An important deal was concluded last week whereby the stamped and pieced tinware departments of the H. Wetter Mfg. Company of Memphis, Tenn., will be removed to Canton, Ohio, and added to and operated under the uame of the Carnahan Stamping & Can Compauy. The new company, who have been organized with a capital stock of $300,000, are composed of members of the following firms: The Berger Mfg. Company, the Carnahau Tin Plate & Sheet Company, and the Stark Rolling Mill Company, all of Canton, Ohio, and the H. Wetter Mfg. Company of Memphis. The site for the factory has been located adjoining the plant of the Carnahan Tin Plate & Sheet Company, recently organized, and a three-story brick factory building and warehouses will be erected thereon immediately. In addition to the manufacture of tinware the new company will take up the production of tin cans and enameled ware. The incorporators of the concern are: J. E. Carnahan, William Blecker, Millard Taylor and Edward A. Langenbach of Canton and A. G. Riley of Memphis, Tenn.

The following officers have been elected: President, J. E. Carnahan, president of the Carnahan Tin Plate & Sheet Compauy; vice-president, William Blecker, formerly of the Cauton Roll & Machine Compauy; secretary and treasurer, Millard Taylor of Canton, and general manager, Edward A. Langenbach. The last named is also general manager of the Berger Mfg. Company, the Stark Rolling Mill Company and the Carnahan Tin Plate & Sheet Company. These four companies, which are closely aliied, will work in unison. A great part of tho product of the Carnahan Tin Plate & Sheet Company will be used by the new stamping company, while the black and galvanized sheets manufactured by the Stark Rolling Mill Company will be consumed by the Berger Mfg. Company and the enameled ware department of the new stampiug concern.

It is likely that the plant of the Carnahan Tin Plate & Sheet Company will be increased from an eight-mill to a 12-mill plant. The four plants named when in full operation will give employment to about 4000 hands. Orders have been placed for about $150,000 worth of machinery and equipment for the new tinware plant. Frank C. Graham of Cincinuati, who promoted the deal, will represent the four concerns in the Cincinnati district.

The Canning Machinery Company.

There have been incorporated at Albany a company for the manufacture of machinery with which to make tin cans. They are to be known as the Canning Machinery Company, and the incorporators are Postmaster Francis H. Wilson, Henry E. Hutchinson, prosident of the Brooklyn Bank, and William H. Hibbard, a manufacturer at 85 Washington street, all of Brooklyn. The company are capitalized at $200,000, and besides the three men named there will be interested financially three others, whose names, however, could not be learned. The plant will be established in Brooklyn and will probably give employment to a large number of men. At prosent the preliminary work will be done in the establishment of W. H. Hibbard, who is a machinist of large experience and who controls a number of inventions and patents which will be used in the now enterprise. While the purpose of the company is given as the making of machinery from which tin cans of all classes can be manufactured, it is the ultimate intention to make tho company a general machine and tool making concern. The exact location of the new company has not as yet been determined upon, but it will be in a section of Brooklyn convenient to points of shipment.

The friends of Clark Parsons, the veteran tinsmith of Kingston, N. Y., are congratulating him on his seventy-fifth birthday, which he celebrated on July 16. Mr. Parsons has been in the employ of the Canfield Stove Company for 56 years and is said to be the oldest tinsmith in that part of the country.

The Laughlin Plant.

THE additions which the American Tin Plate Company are making to their Laughlin plant at Martin's Ferry, Ohio, will, when completed, make it the second largest Tin Plate works in the United States, and, in point of modern improvements and appliances, probably the finest of its kind in the world. The new plant will consist of 32 hot mills. It is formed by the consolidation of the machinery of three plants moved from dismantled plants in Cincinnati and the Pittsburgh district, together with the original Laughlin plant. The works throughout will be run by electricity except in the case of the rolls and the heaviest machinery. A complete system of traveling electrical cranes will do away with all trucks, tramways and railroad switches within the works. The plant is piped throughout for natural gas, and it is also provided with generators for the manufacture of coal gas, for use should the supply of natural gas fail. When complete and in operation the works will employ between 5000 and 6000 men. It is expected that the plant will be ready by the end of this month.

Machine for Coating Tin Plates.

Thomas Kendrick of Swansea Valley, England, has patented in this country a machine for coating tin plates, which is described in the patent as follows:

The usual receptacle for the molten coating material is provided, having at one end an open space for the introduction of the plate, and at the other end the delivery rolls. Arranged longitudinally within the receptacle and extending the entire length are two vertical pairs of rods, between which the plates are introduced. A pushing device is mounted to slide on the rods. It has a handle that projects from the receptacle. In the bottom is located a U-shaped trough in which the plate rests. The trough may be adjusted vertically. This trough is made in sections, one of which is disposed directly below the delivery rolls, and has a handle that passes up through the adjacent bath. The plate to be coated is placed with one edge downward in the usual flux box and passing between the guide rolls or rods it is received upon the trough. The pushing device, having been previously drawn back to the feeding end of the receptacle, is then moved toward the rolls, and in this way impelled along in the bath until it is beneath the rolls and on the movable section of the trough. After this position is reached the trough is raised until the upper end of the plate is gripped by the lowermost pair of rollers, when it is removed in the usual manner.

A HUSTLING ROOFER.

George Glines, 134 West Broadway, New York City, is the kind of "hustler" who gets the business. A postal card sent out broadcast by Mr. Glines bears on its face above the address the statement: "I repair skylights, leaders, gutters, metal awnings or anything about any roof." It then goes on to say: "If you have any doubt about your roof, I will examine it and report exactly what condition it is in without charging you one cent. If it needs no repairs I will tell you so. If the roof needs repairs I will guarantee to make it water tight, or no charge whatever. That is my business."

On the back of the card is printed the following:

I DO NOTHING BUT ROOFING.

It doesn't cost much to keep a roof in good condition if you take it in time and do it right. What costs is letting it go until it is in bad shape, and then getting a man who doesn't half attend to it. I am not a plumber, tinsmith, carpenter or general "handy man."

I am a roofer. Roofing is my specialty. I do it promptly, thoroughly, satisfactorily every time; and I do nothing else.

A plumber may be a mighty good plumber, but he isn't a roofer. Perhaps he will mend your roof thoroughly—perhaps not. Very likely he will "send a man." A plumber or tinsmith or hardware man can seldom attend to your roof as promptly and satisfactorily as I can, because he has other troubles of his own. I haven't any troubles but roofing. I take all the troubles there are at that.

I have had 25 years' practical experience in roofing.

I have the materials, tools and skillful workmen to do it right.

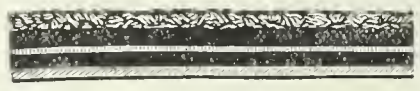
I boss the job myself. I am on hand on every roof that I tackle. I see that it is done as it ought to be. When I am through with it there's no "perhaps" about it.

Without any charge to you I will carefully inspect any leaky or defective tin, gravel, slate, iron or felt roof and submit an estimate of cost to put it in first-class condition.

I have the care of roofs of some of the largest buildings in New York, and my work is widely known for its thoroughness and durability. I can give you plenty of refcrences. All you need do is to drop me a postal card. I will do the rest.

Cork, Asbestos and Gravel Ready Roofing.

Stowell Mfg. Company, 114-134 Culver avenue, Jersey City, N. J., are making several kinds of ready roofings, which are variously covered with cork, asbestos and gravel, according to the requirements of the market or buyer. The cork covered roofing is shown in the accom-



Cork Coated Ready Roofing.

panying illustrations. Fig. 1 is a sectional view indicating it as it is put together, after which it is compressed between heavy rollers to a thickness of but little over ⅛ inch. Fig. 2 reproduces a surface section with the granulated cork, actual size.

Aside from the top layer the materials and method of assembling the different roofings are identical, there being two thicknesses of extra heavy wool felt saturated with asphalt instead of coal tar. The coatings of asphalt cement the two layers of felt and hold on the top layer.

Fig. 2.—Ready Roofing Covered with Granulated Cork.

One of the newer roofings has a top dressing of granulated cork, which is put on while the asphalt is at a proper heat and run between rollers, which securely imbed it in the materlal. This roofing is elastic, nonabsorbent, a nonconductor of heat and will not burn. This roofing is especially recommended by the manufacturers for export, particularly to hot countries, because of its lesser weight, important on account of freight, and also because of the cooler interior where a bullding is so covered. Another ready roofing new to the trade is the same as that described above, except that the top coating is asbestos, an indestructible and fire proof material. There is little difference in weight between the cork and asbestos roofing in a roofer's square (100 square feet).

Another roofing long made by this firm is covered with gravel of various degrees of fineness, the average of the latter being about 50 pounds heavier in a roll of 100 square feet. The gravel and cork coated roofings are about the same price, the asbestos roofing being somewhat higher. All their roofings are guaranteed to be made from the natural Trinidad asphalt, saturated felt and coated with pure Trinidad asphalt only. They

will cheerfully ship on approval with the distinct understanding that if after tho severest comparlson it is not found to be of the highest grade the goods may be returned at their expense. Samples can be obtained from the main office of the company or of their foreign representative, 37 St. Mary Axe, London, E. C., England.

Great Sheet and Tin Plate Strike.

On Saturday night, July 13, President Theodore J. Shaffer of the Amalgamated Association of Iron, Steel and Tin Workers sent out a strike order from Pittsburgh to all the union mills of the American Sheet Steel Company, the American Tin Plate Company and the American Steel Hoop Company, directing all the Amalgamated men employed by those concerns not to go to work on Monday, July 15. This order came as the result of failure to arrive at a settlement of the trouble which had existed in the mills since late in June, when the officials of the Sheet Steel and Steel Hoop companies refused to sign the scale for their non-union mills, as demanded by the Amalgamated Association.

It was confidently expected that at the conference held last week in Pittsburgh between the representatives of the Amalgamated Association and the three concerns named the trouble would have been fixed up and a general strike averted. It was realized that both sides had much to lose by going into a fight, the employees having steady work at the highest wages that have ever been paid, while there was an enormous demand for the products of the three constituent concerns of the United States Steel Corporation above referred to. Moreover, enormous profits were being realized which were needed to meet the heavy fixed charges of the United States Steel Corporation. In spite of all this, the three days' conference failed to effect a settlement, and after the adjournment on Saturday evening the strike order issued by President Shaffer resulted.

When the Amalgamated Association presented their wage scales for the sheet, hoop, bar and tin plate mills for the year beginning July 1, 1901, the advances in wages demanded were conservative and were readily granted by the manufacturers with but slight changes. The Amalgamated Association, however, was prepared to make a more important demand, which was that the scale be signed for all the nonunion mills of the three companies named above. This was refused, the officials of the concerns claiming that in many of their mills the Amalgamated Association had no foothold and that the employees in these mills did not wish to become affiliated with labor organizations of any kind. It was on this rock that the negotiations suffered shipwreck, the result being the declaration of the biggest strike that has taken place since the Homestead strike nearly ten years ago.

The American Tin Plate Company, whose mills have all been closed, with the exception of the Monessen Works, by the strike order of President Shaffer, had no dispute with the Amalgamated Association, but signed the scale as soon as it was presented. Their mills have been shut down by reason of a clause in article 35 of the constitution of the Amalgamated Association, which reads as follows: "Should one mill in a combine or trust have a difficulty all mills in said combine or trust shall cease work until such grievance is settled."

The American Tin Plate Company will be affected most by the strike, as all their mills are union, with the single exception of the Monessen plant, which operates under a special scale. A full list of the plants owned by the American Tin Plate Company, and which are all closed at this writing on account of the strike, is as follows:

American works, Elwood, Ind., 26 mills; Anderson works, Anderson, Ind., 7 mills; Atlanta works, Atlanta, Ind., 6 mills; Banfield works, Irondale, Ohio, 4 mills; Beaver works, Lisbon, Ohio, 7 mills; Canonsburg works, Canonsburg, Pa., 5 mills; Champion works, Muskegon, Mich., 8 mills; Crescent works, Cleveland, Ohio, 6 mills; Cumberland works, Cumberland, Md., 5 mills (no tin house); Cambridge works, Cambridge, Ohio, 6 mills; Ellwood works, Ellwood City, Pa., 6 mills; Falcon works, Niles, Ohio, 6 mills; Great Western works, Joliet, Ill., 4 mills; Humbert works, Connellsville, Pa., 6 mills; Irondale works, Middleton, Ind., 6 mills; Johnstown works, Johnstown, Pa., 2 mills; La Belle works, Wheeling, Pa., 10 mills; Laughlin works, Martin's Ferry, Ohio, 14 mills, adding 8 more mills; Monongahela works, Pittsburgh, Pa., 14 mills; Morewood works, Gas City, Ind., 8 mills; New Castle works, New Castle, Pa., 20 mills; Pittsburgh works, New Kensington, Pa., 6 mills; Reeves works, Canal Dover, Ohio, 7 mills; Pennsylvania works, New Kensington, Pa., 6 mills; Shenango works, New Castle, Pa., 30 mills; Star works, Pittsburgh, Pa., 8 mills; United States works, McKeesport, Pa., 11 mills.

The American Sheet Steel Company are more fortunate than the tin plate company in having some of their largest mills running nonunion, and it is expected that these will continue to run right along in spite of the efforts of the Amalgamated Association officials to shut them down. The nonunion sheet mills which are likely to run are: The Apollo Works at Vandergrift and Apollo, Pa.; the Old Meadow Works and Scottdale Works at Scottdale, Pa.; the Saltsburg Works at Saltsburg, Pa., and the Kirkpatrick Works at Leechburg. These plants combined are able to turn out nearly half of tho entire product of sheets made by the American Sheet Steel Company. In addition to the above named are the Dewees-Wood plant at McKeesport, Pa., and the works at Wellsville, Ohio, both of which turn out specialties in the line of sheets and have been run on a nonunion basis. It was stated that attempts would be mado to start up these works before the end of the present week, but so far nothing much was accomplished in that direction. Late accounts say, however, that the officials expect to have them running by Monday.

Most of the independent sheet and tin plate mills have signed the Amalgamated Association scale for 1901, among them being the following:

The Waynesburg Sheet & Tin mill at Waynesburg, Pa.; the American Rolling Mill Company's works at Muncie, Ind., Middletown, Ohio, and Muskegon, Mich.; the Wheeling Steel & Iron Company, Wheeling, W. Va.; Zug & Co., Limited, Pittsburgh, Pa.; N. & G. Taylor & Co., Cumberland, Md.; Sharon Tin Plate Company, South Sharon, Pa.; Niles Iron & Sheet Company, Niles, Ohio; the sheet mills of the Republic Iron Works, Pittsburgh, Pa., and Newport Rolling Mill, Newport, Ky.

Late advices from Pittsburgh state that the efforts of the Amalgamated Association officials wore being concentrated on trying to get men to come out of the nonunion mills of tho American Sheet Steel Company. So far, however, this has not been successful. It is added that the Amalgamated Association officials seem to have trouble in holding their men in line. Many of the men already seem restless and anxious to return to work, and it is pretty safe to assume that with many of them, if they had to do it over again, they would not go out on a strike. The Amalgamated Association officials on Thursday issued an address to the sheet workers in the nonunion mills giving arguments in favor of joining in the strike.

A phase of the situation toward the close of the week was an offer from the Ohio State Board of Arbitration to bring about a settlement of the strike. The comment on this action made by M. M. Garland, former president of the Amalgamated Association, is to the point: "I cannot see," said Mr. Garland, "what there is to arbitrate in this question. It cannot be settled except by a complete backdown on one side or the other on a matter of principle."

An unusual feature of the present strike is that for the first time in the history of the Amalgamated Association they do not appear to have the sympathy of the public in declaring a strike on the present grounds. The officials of the Amalgamated Association, it is said, were not unanimous in declaring the strike, but, on the contrary, President Shaffer was strongly opposed by some of the leaders in the course he pursued. While nothing official has been given out, one thing is certain, and that is if the United States Steel Corporation have gone into this fight to stay to a finish it means the defeat and ultimate disruption of the Amalgamated Association. The only real strength that body has is in the sheet and tin plate mills, making only about one-half of the output of the American Sheet Steel Company. The present strike is largely one of sympathy, and after the men have been out a week or two and have had time to study the conditions surrounding the strike, it is not unlikely

that numbers of them will return to work. Meanwhile the situation is sufficiently serious, as indicating the possibility of a protracted and costly labor struggle which may involve many allied interests.

FLASHINGS.

THE G. DROUVE COMPANY, Bridgeport, Conn., are doing the copper work on the Blithwood residence in Barrytown, N. Y., and on the Flagler mansion at Palm Beach, Fla. They are also busy with a number of smaller contracts.

T. J. GIBSON & Co., Holyoke, Mass., are completing the gravel roofing of a large block on Chestnut street for John St. John. They also have a large contract for concrete floors for the Chemical Paper Company, Holyoke.

THE bar mill at the American Sheet Steel Company's Falcon Works, Niles, Ohio, is being torn out and will be replaced with a heavier mill, removed from the Struthers, Ohio, plant.

THE Galvanized Sheets made by the New Process Galvanizing Company at Niles, Ohio, are reported to be gaining steadily in reputation, on account of their excellent qualities. The composition coat of lead and spelter with which they are treated is claimed to adhere so closely to the Sheets that they do not crack or peel under any conditions. The company have recently made some considerable importations of Black Sheets from England, owing to inability to obtain a sufficient supply in this country. They state that the quality of the iron they have received from abroad is excellent. The Sheets are made of rerolled Muck Bar and said to be softer and better than the ordinary Steel Sheets. So pleased are the concern with their experimental importations that it is understood they have made a large contract for deliveries of English Sheets extending over a long period.

ONE of the largest Roofing contracts ever let in New England is that for the new building of the New York, New Haven & Hartford Railroad shops at Readville, Mass. It has been secured by the Horton & Hemenway Company of Providence, R. I. The building will all be covered with Perfect Granite Roofing, made by the Eastern Granite Roofing Company, Gerken Building, New York City.

THE AMERICAN SHEET STEEL COMPANY have dismantled the Bar mill at their new Philadelphia, Ohio, plant and will replace it by a Sheet mill.

THE TYLER CAN COMPANY of Baltimore, Md., have taken over the Can making plant of Kirwan & Tyler and will make all kinds of Tin Cans.

AMONG the improvements to be made in the near future in the Sheet and Tin Plate plant of the Lalance & Grosjean Mfg. Company, at Harrisburg, Pa., is the installation of two electric traveling cranes and seven gas producers. Two additional Tin mills and one stand of cold rolls will also be added.

THE new Sheet mill at the American Sheet Steel Company's plant at Struthers, Ohio, is ready for operation and will be put to work as soon as the present labor troubles are settled.

A REPORT from England states that some of the Welsh Tin Plate manufacturers are arranging to visit the United States for the purpose of inspecting the works on this side.

ARTICLES of incorporation of the National Can Mfg. Company were filed this week in Brooklyn, N. Y. The incorporators are: Francis H. Wilson, William H. Hibbard and Henry E. Hutchinson. The company are capitalized at $200,000, $110,000 of which has been paid in. The purpose of the new concern is the manufacture and sale of Can Making Machinery and plain and lithographed Tin Cans.

THE EDWARDS MFG. COMPANY, successors to Art Metal Relief Company, Pike and York streets, Covington, Ky., are now manufacturing a complete line of Architectural and Ornamental Sheet Metal Work and Statuary, Zinc and Copper Ornaments and Relief Work of every description. They are prepared to make prompt shipments and would be pleased to send catalogue showing complete line to parties interested.

THE AMERICAN SHEET STEEL COMPANY have recently purchased about 700 acres of coal lands located near their Ætna Standard Works, at Bridgeport, Ohio. The land adjoins 600 acres bought by the same concern recently.

THE UNCLE HIRAM ROOFING COMPANY of Nashville, Tenn., have been incorporated with a capital of $10,000 to do a general Roofing business by John L. Ward, T. B. Agerton, W. S. Poindexter, W. H. Lindsey and J. E. Scott. The officers of the company are: John L. Ward, president; T. B. Agerton, vice-president, and W. S. Poindexter, secretary and treasurer.

The Persian Dwelling House.

There is still probably in the minds of most people who have not been in the East, says the *British Medical Journal*, a glamour of poetry about the very name of Persia, doubtless traceable to the "Arabian Nights." But, alas, medical science is terribly realistic, and not all the fabled perfumes of Araby can make a Persian town sweet to a sanitarian nose.

According to Dr. M. G. H. Paschayan of Tauris the ordinary Persian dwelling house is the very negation of comfort as well as hygiene. Hidden away behind high mud walls the houses themselves are low and narrow, and have but one opening—to wit, the door. They are caves or holes rather than houses. They are usually some steps below the level of the ground, and the mud roof, which is flat, forms a terrace where the people sleep in summer. The latrines are in a courtyard just outside the dwelling.

The typical room is small, with a narrow window, or rather hole, without glass, and a low door which often does not shut. Air and light penetrate with difficulty, consequently the houses are always damp. There is scarcely any furniture, except a bed, which is on the ground, and is large enough to hold the whole family.

In the houses of the wealthy the floor is covered with the large, soft carpets for which Persia is famous, but in the ordinary houses the floor is formed by the earth, which is bare, or covered only with coarse matting. Along the walls, which are plain mud, not whitewashed, are cushions, but there are no chairs, tables or curtains. The people sit on the ground on their hams, or with their arms crossed in the Turkish manner, and at meals the cloth is laid on the floor. The fire is in the middle of the room. The *tandour*, which takes the place of a stove, consists of a brazier, into which are put small pieces of charcoal, and a square wooden table standing over the brazier, and covered with a large cloth, which hangs down over the sides. It is not surprising to learn that children are often asphyxiated by the carbonic acid and carbon oxide from the smoldering charcoal. These *tandours* are a common cause of rheumatism, owing to the great difference of temperature in them and in the rest of the room. Within the *tandour* it is from 40 to 60 degrees C., while in the apartment it may be as low as 10 to 15 degrees. Only the wealthier Persians have a stove and chimney. There is another *tandour* underground where baking and cooking are carried on. The smokes escapes how it can.

The poorer Persians have little in the way of cooking utensils, while the rich, who possess them in plenty, are utterly indifferent as to their cleanliness. By reason of the extreme filthiness of the dwelling and its furniture, the want of light and air, and the confined space, Persians suffer much from anæmia, phthisis and other diseases depending on insanitary conditions.

The fire loss of the United States and Canada for the month of June, as compiled by the New York *Journal of Commerce*, shows a gratifying decrease as compared with the figures of the preceding months of this year, being $9,599,000, as against $22,380,000 in the preceding month, and $21,281,000 in June, 1900. The total loss for the first six months of the year, however, is very heavy, aggregating $88,935,000.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

CISTERN FILTER.

From E. L. S., Kansas City.—Will *The Metal Worker* or some of its readers kindly advise me of the best way to make a filter for a cistern? The water is to course from a roof and I would like to filter the same before it enters the cistern. Or would it be better to have it made in two parts, divided by a wall, so that the water would filter through same?

Answer.—The following advice on this subject was given by a contributor in a former issue: "In answer to the correspondent who wants to know how to make a filter, I will describe the way I made my filter. I got an oil barrel and cut it in half, and used one part, cutting an 8-inch hole in the center of the bottom. Over this hole I fastened a cylinder of galvanized sheet iron pipe 9 inches in diameter, which was perforated with ¼-inch holes around the bottom, and which extended to the top of the half barrel. I then made a cover of prime lumber to fit the diameter of the half barrel and cut a hole in it at one side to admit the elbow from the conductor pipe. The barrel was then filled two-thirds full of charcoal and about one bucketful of coarse gravel was put on top of the charcoal to mix with it. This I have found a good water filter."

WANTS A SMALL ICE MACHINE.

From F. K., San Francisco, Cal.—I would like to learn through the columns of *The Metal Worker* the process of making ice in small quantities, also how to make such an apparatus, with complete description of its construction.

Answer.—The only ice making apparatus on a small scale or for a few pounds of ice that is simple in construction is operated by adding nitrate of ammonia to water in equal parts in an annular chamber containing a vessel of water to be frozen. The temperature of this mixture falls from 50 degrees to 4 degrees above zero Fahrenheit.

COATING FOR GALVANIZED TANK.

From J. R. Q., Memphis, Tenn.—Having seen the inquiry of "A. L. B." in *The Metal Worker* of July 13, I would suggest that he can probably find no better coating for his galvanized iron tank than a good asphaltum varnish. This is well known as a sticker, and in all probability will not trouble him by peeling off. Further, there is nothing in good varnish of this kind that will detract from the quality of good drinking water, while this is not altogether true of the zinc which forms the galvanized coating of the tank. In all warm climates the purity of drinking water is important. I doubt if zinc, even in small quantities, in solution in drinking water is of any benefit in Florida. So, by all means, the galvanizing should be covered with some impervious coating, and I know of none better to recommend than asphaltum varnish.

SMALL FLUES HINDER HEATING.

From Bedford Park, Brooklyn.—Having seen the inquiry of "J. T. B." in *The Metal Worker* of July 13, I would make the following comments and suggestions: It is probable that a larger cold air supply would prove of benefit. Owing to the point from which the cold air is supplied some benefit may be derived by the use of a cold air room in the cellar and leading a cold air duct from this room to the furnace. This cold air room need not be more than 5 or 6 feet square, but it would go a long way toward preventing reverse action in the cold air duct and so insuring a good flow of warm air from the heating pipes. Inasmuch as the furnace has not been altogether satisfactory, it is probable that if the pipes to the dining and sitting rooms were increased to 12 inches in diameter and connected with floor registers located near the chimney, a substantial improvement would be effected. As the size of the hot air flues leading to the different rooms is not given, it is assumed that they are the thin flat flues ordinarily used in a partition. These are not capable of furnishing any large volume of hot air and frequently are the cause of unsatisfactory heating, large consumption of fuel, necessity of repairs to the furnace, and a hot cellar. The description given of the furnace would lead to the conclusion that it has ample capacity for heating the building in which it is used, owing to the low ceilings. It certainly has capacity for filling pipes of larger diameter than those used. The use of a 12-inch pipe to the hall register might further add to the efficiency. It would be better for "J. T. B." to explain to his customer what he intends to do and leave it to the customer to accept the work, than to guarantee a 70-degree temperature in a building in which he has not run the heating flues, but has to utilize those now existing of whatever size they may be.

CLEANING ZINC.

From M. J., Flatbush, N. Y.—Having seen the inquiry of "W. B." in *The Metal Worker* of July 13, I would say that we have recommended to our customers the use of oxalic acid. This can be purchased at any drug store. If a teaspoonful is dissolved in a half pint of water it will be ready for use. It is only necessary to apply it with a sponge or soft flannel cloth to the zinc to be cleaned. As soon as all dirt and oxidization is removed by the action of the acid the zinc should be washed quickly with plenty of clean water to remove both the acid and the dirt. As soon as washed it should be rubbed dry and polished with dry whitening. This will leave the zinc looking bright and almost the same as new. After this is done, if the suggestion given to coat the zinc with varnish or lacquer is followed, the zinc, where the varnish is not worn off, will continue bright for a long time. This method has been used by our customers for several generations and can be recommended as satisfactory. Elbow grease is quite a factor in securing a satisfactory polish.

From W. T. A., Toledo, Ohio.—If "W. B.," whose inquiry for a method of cleaning zinc appears in *The Metal Worker* of July 13, will buy 5 cents' worth of salts of lemon, called oxalic acid, and place it in a ½-pint cup of hot water, he can clean the zinc, and dry it with whitening and a soft rag. I have used it for 35 years to clean all kinds of zinc goods.

CONFERENCE RESOLUTIONS VIOLATED.

From W. W. C., Kingfield, Maine.—Please inform me whether a wholesale plumbing house has a right to sell a private individual of a water company bathroom fixtures, &c., for his own use.

Answer.—A resolution which has been agreed upon by the National Association of Master Plumbers and the supply associations exempts some corporations, but not the individuals connected with them. It is quite certain that if the question presented was brought to their notice it would be decided that such a sale would be a violation of the provisions of these resolutions.

WILL PIPE COVERING STOP SWEATING?

From G. E. S., East Stroudsburg, Pa.—I wish *The Metal Worker* or some of its readers would inform me of the best covering to use to keep water pipes from sweating in a basement.

The *Commercial and Financial Chronicle* shows the aggregate gross earnings of railroads in the first half of 1901 to be $658,411,827, an increase of $61,580,231 over the first half of 1900, of about $164,000,000 over three years ago and $267,000,000 over six years ago.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is very dull and ¼ cent lower.

Copper is quiet and unchanged.

Pig Lead remains firm and without change.

Spelter is extremely dull at former prices.

Antimony is inactive and unchanged.

Nickel is firm in price and scarce.

Aluminum continues active at former prices.

Tin Plates are from 25 cents to 50 cents a box higher owing to shut down of mills.

Black Sheets are about ¼ cent higher from the same cause, and likely to advance further.

Galvanized Sheets are very strong with upward tendency.

Old Metals are quiet and without change.

Pig Iron is firm with a good tone; prices unchanged.

Sheet Copper continues in good demand at former prices.

Hardware is moving in good volume with prices firm and steady.

Plumbers' Supplies show considerable activity; prices are strong in all lines.

Wrought Iron Pipe is scarce and very strong in price.

Cast Iron Soil Pipe and Fittings are also in large demand and scarce in some sizes; prices hold firm.

Galvanized Range Boilers are likely to be advanced 10 per cent.

Steel Clad Bathtubs have been marked up 5 per cent.

Plumbers' Brass Goods are stiffer.

Radiation has been advanced 10 per cent.

Roofing Slates are firm and in good demand.

Tinware has stiffened on the strength of the strike at mills.

Wire Nails are moving more freely.

Cut Nails are firmer in price.

Wire is in heavy demand and prices rule very firm.

White Lead is unchanged and in moderate demand.

Linseed Oil is firm and may go higher.

Spirits Turpentine is quiet and prices are steady.

METAL MARKET.

Office of *The Metal Worker*, 232-238 William street, New York. July 19, 1901.

Pig Tin.—Business has been very dull, the demand from consumers being extremely tame. The principal reason advanced for this state of affairs is the protracted hot spell, during which many of the Tin Plate mills were forced to close, and the strike which has now shut up almost the entire Tin Plate capacity of the country. The squeeze on spot Tin still continues in London, and prices here are considerably below the figures ruling in that market, although London prices have declined somewhat since last week. Future deliveries here are entirely neglected. At the close prices were merely nominal. Jobbers' quotations are about ¼c. lower than a week ago, Straits Pig in small lots ruling at 28½c. to 28¾c. per lb.

Copper.—The market has been dull and without any points of interest. The demand, both from home and foreign buyers, is limited, and prices show no change from those ruling for some weeks past. Lake Ingot in small lots is quoted at 17¼c. to 17½c. per lb., and Casting Copper at 16¾c. to 17c.

Sheet Copper.—The manufacturers of Sheet Copper report a satisfactory and well distributed demand for their product. Prices are firmly maintained on the basis of 21c. per lb. for moderate sized lots of Sheet Copper from store.

Pig Lead.—No change whatever has taken place in this market. The demand is of moderate proportions and prices are held steadily at 4.60c. to 4.62½c. per lb. for small lots of American Pig. St. Louis advices report that business continues in good volume in that market. Chemical Lead is practically not obtainable and is slightly higher, otherwise prices show no change.

Spelter.—Dullness is the ruling feature of this metal. The strike in the Sheet mills is liable to still further curtail the demand for Spelter, as so many of the large galvanizing plants are closed down in consequence. Good Western brands in small lots are quoted at 4.45c. to 4.50c. per lb. No change has taken place in the St. Louis market. Sales are of ordinary proportions and prices unchanged.

Sheet Zinc.—A fair seasonable demand for Sheet Zinc is reported. Jobbers quote 600-lb. cask lots at 6¾c. per lb. and smaller quantities at 7¼c.

Antimony.—Business is not active and prices are unchanged. Cookson's in small parcels rules at 10½c. to 11c. per lb., and Hallett's at 8¾c. to 9½c.

Nickel—Is firm and without change. Small lots are quoted nominally at 60c. to 65c. per lb.

Aluminum.—The demand for Aluminum continues active at former prices—viz., 37c. per lb. for small lots of No. 1 Ingot, guaranteed 99 per cent. pure, and 35c. for 100-lb. lots.

Tin Plates.—The situation in the Tin Plate market has been unexpectedly complicated by the shut down of practically all the mills. This places the trade in a serious position so far as the consumer is concerned, because the supply of Plates available from sources other than the American Tin Plate Company is extremely limited, and even of that supply a very large share is already controlled by consumers of the goods. Consequently the output at present available for the market is insignificant. As the American Tin Plate Company have been for some time past considerably behind in their shipments on contracts, the present stoppage of output is liable to cause serious inconvenience to the consumers of Tin Plates. In common with Sheets, the demand for Tin Plates of late has outstripped the productive capacity, and stocks are down to the smallest possible limit; in fact, there has been for some time almost a growing famine of certain sizes of Coke Tins. This stringency will now become absolute, as the mills have very little stock on hand available for shipment. The dealers in Tin Plates are naturally anxious as to the future, and rumors are already pointing to the placing of some large orders for Plates abroad. Since early in the current year Plates for prompt shipment have commanded a handsome premium over current rates. Notwithstanding, the American Tin Plate Company have held firmly to their quotations and even recently announced their willingness to take orders for delivery in the last quarter of the year at the figures now ruling. Jobbers who have any stocks on hand are naturally reaping the benefit of the present condition of stringency in the market and have advanced prices from 25c. to 50c. a box or more. They have comparatively little stock to offer, however, consequently quotations can only be given nominally. American Bessemer Coke Plates I C, 14 x 20, are almost impossible to get in small lots at less than $5.25 per box, and I X, 14 x 20, at $6.50 per box.

Sheets.—The immediate effect of the strike of the Sheet mill men has been to stiffen the price of Sheets all along the line. It is recognized by the trade that the shut down of more than half the capacity of the American Sheet Steel Company, when they are already far behind in their deliveries, is going to give serious trouble to consumers. Outside mills that have signed the Amalgamated Association scale are running full and most of

them have marked up their prices, but even with all the independent mills in operation, together with the non-union plants of the combine, the aggregate output of Sheets will necessarily fall far behind the consumptive demand, which is still extraordinarily heavy. Stocks in jobbers' hands are extremely light, and of some of the more popular gauges they are practically bare. Prompt delivery of any kind of Black or Galvanized Sheets cannot be had from any quarter, except at a handsome premium over the regular prices. Light Sheets are especially scarce. Jobbers in this district have generally advanced their quotations on Black Sheets, but such advance is not regular, consequently it is impossible to give absolute quotations on Sheets at this time. For purposes of record we may quote nominally No. 27 Black, One Pass Cold Rolled Soft Steel Sheets at 3.85c. to 3.95c. Galvanized Sheets continue in very heavy demand and are also hard to obtain except in quite small lots. The conditions governing this class of Sheets are similar to those above outlined in connection with Black Sheets, consequently prices, although not marked up in the same ratio, are very strong and with every indication of an early rise. Jobbers are quoting Galvanized Sheets in small lots at 62½ and 5 per cent. to 65 per cent. off. The condition of things in the Sheet market, as developed by the strike, indicates serious possibilities in the near future, should the shut down of the mills be prolonged. The mills for some time past, while operating to their fullest capacity, have been unable to keep pace with the existing demand. With the prospect before them of a material reduction in the output for an indefinite time and the bare condition of their own stocks jobbers are anxious as to the future. Consumers are clamoring for shipments which they are unable to make. Already there is a talk in the trade of orders for Sheets being placed abroad, but the importers as a rule are hesitating about placing any substantial orders on the other side, because they could not well obtain shipment of the same sooner than a month or six weeks ahead, by which time the domestic mills, it is to be hoped, will again be in operation. It is more than likely, however, that if no signs of a settlement appear within a week or two that a good deal of business will go across the water. Meanwhile, consumers who are figuring upon contracts involving the use of Sheets will do well to communicate immediately with their jobbers, with a view of assuring themselves as to the prospect of obtaining supplies of material, and also to learn at what prices they can buy, for there is no telling from day to day how the market will go.

Chicago advices are as follows: The trade has been thrown into a state of consternation by the strike in the Sheet mills. Manufacturing consumers have been unable to accumulate any stock owing to the oversold condition of the mills for the last six months, and they find themselves encountering a condition of absolute scarcity. The independent mills can only supply a small fraction of the requirements of the trade. Jobbers are saving their stocks as much as possible, and no suspicion of a cut price is now entertained. The demand on their stocks is heavy and will continue to become more so if the strike lasts any length of time. Black Sheets are held at 3.40c. upward for No. 27, depending on the views of the seller, while Galvanized Sheets cannot be had lower than 70 off with a disposition to advance prices to 65 and 10.

Old Metals.—Comparatively little business is doing but prices remain without material change. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 15 c.
Light and Tinned Copper	per lb. 13½c.
Heavy Brass	per lb. 10 c.
Light Brass	per lb. 8 c.
Lead	per lb. 4 c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 18½c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	$6.00
Wrought Iron Scrap, per gross ton	$10.50 to 11.00
Heavy Cast Scrap, per gross ton	10.00 to 10.50
Stove Plate Scrap, per gross ton	7.00 to 7.50
Burnt Iron, per gross ton	5.00 to 5.50

THE PIG IRON MARKET.

New York.—The market in this district has been very flat, sales being very limited. Some keen competition has developed between Southern makers over one moderate sized order in New England. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, $16 to $17.50; No. 2 X, $14.75 to $15.75; No. 2 Plain, $14 to $14.50; Tennessee and Alabama brands, No. 1 Foundry, $14.75 to $15; No. 2 Foundry, $14 to $14.50; No. 1 Soft, $14.50 to $15; No. 2 Soft, $14 to $14.50; No. 3 Foundry, $13.25 to $13.50; No. 4 Foundry, $12.75 to $13.25.

Chicago.—Furnace agents have done some business during the past week, but it has included very little Foundry Pig Iron. The immediate cause of lack of demand for Foundry Iron is the strike of molders, which began Monday morning, but happily confined to Chicago and seems not likely to spread. Foundrymen are not disposed to purchase materials until they know that a settlement is to be effected. Prices continue about the same as previously reported. The local furnace companies are not disposed to make lower quotations, having their order books well filled for the greater portion of the year. The Southern companies are in the main fairly firm and a large Virginia company selling in this market announce that no effort will be made to secure large business, as the company are now in possession of good contracts which will keep them in excellent condition for several months. Southern Foundry Iron may perhaps be shaded 25c. per ton on our quotations. We quote as follows:

Lake Superior Charcoal	$17.00 to $18.00
Local Coke Foundry, No. 1	15.50 to 16.00
Local Coke Foundry, No. 2	15.00 to 15.50
Local Coke Foundry, No. 3	14.50 to 15.00
Local Scotch, No. 1	15.75 to 16.25
Ohio Strong Softeners, No. 1	16.00 to 16.50
Southern Silvery, according to Silicon	14.90 to 15.15
Southern Coke, No. 1	14.65 to 14.90
Southern Coke, No. 2	14.15 to 14.40
Southern Coke, No. 3	13.65 to 13.90
Southern Coke, No. 1 Soft	14.65 to 14.90
Southern Coke, No. 2 Soft	14.15 to 14.40

Philadelphia.—The market has a good tone and prospects for the near future are regarded as favorable. Stability and uniformity are the leading features. Conditions are such that there cannot be much, if any, change in prices, and for the present there seems to be nothing in sight likely to cause any serious interruption. Consumers of Iron in this vicinity have bought liberal quantities, some for deliveries during the third quarter; others have covered for the entire year, besides which there is an excellent day to day demand. Operations of this character indicate a degree of confidence which is very encouraging, and is ample proof that as yet business is not taking any back tracks. Prices are virtually the same as for some time past. For the general run of business prices are about as follows for Philadelphia and equivalent points: No. 1 X Foundry, $15.75 to $16; No. 2 X Foundry, $15 to $15.25; No. 2 Plain, $14.25 to $14.50.

Pittsburgh.—The market is practically lifeless, all interest being centered on the strike. The nominal price of Bessemer Iron in small lots is $15.25, Valley, or $16, Pittsburgh. None of the large consumers are buying, and only small lots of 25 to 50 tons are selling. Foundry Iron is quiet and prices seem weak. We quote: No. 1 Foundry, $14.50 to $15; No. 2, $14 to $14.50; No. 3, $13.75 to $14. We note a sale of 100 tons of No. 2 Foundry at about $14.10, Pittsburgh.

Cincinnati.—The situation in the Pig Iron market shows a very decided change for the better. It is estimated that the selling agencies at this point booked about 50,000 tons of new business within the past seven or eight days. The selling, however, was done at something of a concession on the quotations as given herewith. One thing appears very manifest, and that is that the market is much stronger and brighter than it has been for quite a number of weeks past. Judging by the volume of inquiry there will be a pretty fair amount of business transacted throughout the coming week, and while prices may not start upward just immediately it is pretty safe to say that there will be no more cutting for the time being. Among the trades made were quite a number for Northern Iron, which

still maintains a relatively stronger position in the market than the Southern product. We quote, f.o. b. Cincinnati:

Southern Coke, No. 1	$13.50 to $13.75
Southern Coke, No. 2	13.00 to 13.25
Southern Coke, No. 3	12.25 to 12.75
Southern Coke, No. 4	11.75 to 12.00
Southern Coke, No. 1 Soft	13.50 to 13.75
Southern Coke, No. 2 Soft	13.00 to 13.25
Southern Coke, Gray Forge	11.75 to 12.00
Southern Coke, Mottled	11.75 to 12.00
Ohio Silvery, No. 1	15.50 to 16.00
Ohio Silvery, No. 2	14.50 to 15.00
Lake Superior Coke, No. 1	14.50 to 15.00
Lake Superior Coke, No. 2	14.00 to 14.50
Lake Superior Coke, No. 3	13.50 to 14.00

ST. LOUIS.—There has been considerable improvement in the demand for Pig Iron during the past two weeks and all indications are favorable for continued improvement. The market may be said to be active and satisfactory, but in prices there is but little change. Several large sales were reported last week. We quote carload lots as follows, f.o.b. St. Louis:

Southern, No. 1 Foundry	$14.25 to $14.50
Southern, No. 2 Foundry	13.50 to 13.75
Southern, No. 3 Foundry	13.00 to 13.25
Southern, No. 4 Foundry	12.50 to 12.75
No. 1 Soft	14.25 to 14.50
No. 2 Soft	13.50 to 13.75

CHICAGO REPORT.

Scrap Iron and Steel.—Trade is light. Consumers are buying practically nothing and dealers are waiting for developments. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap	$10.50 to $11.00
Machinery Cast	10.00 to ....
Malleable Cast	10.00 to 11.00
Stove Plate (free from burnt)	7.00 to 7.50
Burnt Iron and Grate Bars	5.50 to 6.00
Sheet Iron and Hoops	6.00 to 7.00
Plow Steel	9.00 to 10.00
Breaking Stock	9.00 to 9.50
No. 2, such as Shovels, Hoes, &c	.... to 7.00
Old Boilers—whole (Iron)	.... to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	9.50 to 10.00
Old Gas Pipe and Boiler Tubes	9.50 to 10.00
Cast Borings	.... to 3.75
Turnings	8.00 to 8.50
Horseshoes	11.00 to ....

Old Metals.—The market is dull, but prices are holding fairly steady. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	15 c.
Copper Bottoms	13½c.
Copper Clips	14½c.
Red Brass	13½c.
Yellow Brass	10 c.
Red Brass Borings	11½c.
Yellow Brass Boriugs	9 c.
Light Brass	7¾c.
Pipe Lead	4 c.
Tea Lead	3½c.
Zinc	2¾c.
Pewter, No. 1	19 c.
Pewter, No. 2	10 c.

Old Rubber.—Dealers report very little business. Buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$23.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7¾c.
Rubber Car Springs	....	4¾c.
Inside Bicycle Tubing	....	21 c.
Outside Tubing	....	7¼c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—Dealers are having a heavy trade and report a short supply in local yards, with no Egg in stock. Another advance will be made August 1. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.25	6.50
Kansas City, Mo	8.25	8.50

A discount of 20c. from these figures is allowed on all Coal ordered to be shipped in July.

THE HARDWARE TRADE.

There have been thus far very few changes in price during the present month. There has been especially very little new in the way of announcement of revised list prices. Some revised discount sheets have been issued and others are to be expected. Many minor changes have been made by manufacturers in preparing for the fall business, but, as a rule, prices are without important modification. The tone of the market generally is decidedly firm. In some lines a strong and confident feeling prevails. The strike among the Steel workers naturally attracts the attention of all branches of the trade, and it is recognized that much depends on the course things may take. A possible shortage of material is one of the results which is apprehended if the contest is of long continuance. In this case inconvenience will be caused manufacturers and the trade, and possibly higher prices in some lines may develop. Business throughout the country continues to move along in excellent volume. Manufacturers are beginning to send out travelers and are receiving their first reports, which are said to indicate a very satisfactory condition of things. The jobbing trade are preparing for a large business, and in some lines have been placing their orders a little earlier than usual. The smaller trade are generally doing a good business. Notwithstanding the damage caused to the crops by the drought, the prevalence of which it is hoped has been broken, the crop conditions are unquestionably on the whole favorable, and a basis for substantial prosperity throughout the country at large is thus laid. There is little ground for special complaint in regard to collections. Altogether, the situation continues satisfactory and the outlook promising.

NOTES ON PRICES.

Wrought Iron Pipe.—The Wrought Iron Pipe market is getting into a more chaotic condition as the days go by. It is probable that not a single jobber in New York City to-day has a complete stock, *i.e.*, a stock of Pipe containing all of the different sizes used by the plumbing and heating trade. If they are long on some sizes they are short on others. The galvanizing plants are glutted with Pipe awaiting an opportunity to be galvanized. All of the jobbing houses are complaining of the scarcity of Galvanized Pipe, and they are willing to buy it at any price in order to fill orders placed with them some time ago, thereby lessening the complaints which are continually pouring in upon them. Three-quarter-inch Black and Galvanized Pipe is practically an unknown quantity in this section; ½-inch pipe, both Black and Galvanized, is reported to be extremely scarce this week; and 1¼-inch Pipe, while not so much in demand as it will be a month from now, is held at a higher price than are the 1 inch, 1½ inch and other sizes. This discrimination in the prices of the different sizes is due entirely to the demand for these particular sizes. The jobbers realize the fact that the plumbers and steam heating contractors must have these sizes to complete their work, and they also realize the fact that there is no possibility of procuring shipments from the mills under two months at the earliest, so they do not hesitate to make all the money they can while the present situation lasts. Under these circumstances our quotations on Wrought Iron Pipe must be taken as merely approximate, for it is impossible to give them absolutely.

Cast Iron Soil Pipe and Fittings.—Cast Iron Soil Pipe and Fittings, particularly the 4-inch standard and 4, 5 and 6 inch extra heavy sizes, are extremely scarce. It is said that none of the Eastern plants operated by the Central Foundry Company have any considerable stock of these sizes on hand. This condition of affairs is also true of the foundries of the independent manufacturers. There has been an enormous demand for all kinds of Pipe and Fittings; shipments have been slow and all of the plants of the Eastern founders are running much beyond the allotment accorded them by the pool. This condition of affairs is likely to continue until well toward the end of the year. The present agreement between the manufacturers, it is understood, will be re-

newed at that time, and prices maintained all through next year. There are no new foundries going up; and even if there were the demand is so great, and will continue so for some time, that the advent of new manufacturers would not change this phase of the market. The trade is satisfied with the prices now quoted. This is true of the jobber as well as of the plumber, and so long as there are no complaints on the score of prices, and the present condition of stability remains, the only question of importance remaining is the matter of getting shipments more promptly. If any change takes place within the next month, it probably will be in the nature of an advance over the prices now in effect.

Galvanized Kitchen Range Boilers.—The strike of the Steel workers has forced upon the manufacturers of Kitchen Range Boilers the fact that it will be impossible for them to secure any Steel or Iron Sheets with which to make their Boilers, and as the stock of Sheets now on hand is very low in all of the plants controlled by the Range Boiler Association, there will almost certainly be an advance within the next few days which is likely to be in the neighborhood of 10 per cent. over the prices ruling since the middle of April. The condition of the Range Boiler Association is much better at the present time than it has been at any time during this year. There are less orders for Boilers on hand at present than there have been since the formation of the association. All of the manufacturers are having difficulty in procuring the raw material, and none of them are anxious or in a position to take the business at any prices other than those issued by the association.

Steel Clad Bathtubs.—The manufacturers of Steel Clad Bathtubs and All Steel Enameled Bathtubs advanced prices 5 per cent. on the 15th inst. This advance is credited to the fact that there is a very limited number of Sheets on hand at any of the plants where these Tubs are made. It was learned this week that one of the manufacturers has had orders placed for Steel Sheets since December of last year, and will not be able to get them before next month, and unless the strike at the Sheet mills is settled promptly, this manufacturer will not be able to get the Sheets in that time. The jobbers in New York, who have a stock of these Tubs, are holding them for higher prices. The cost of "pick ups" in New York City on all kinds of goods into which Sheet Steel and Sheet Iron enter has been advanced 10 per cent. This, we learn, is owing to an agreement at which the jobbers have arrived with themselves, as they feel that the strike at the mills is liable to be a protracted one, and that even if it is settled promptly, the manufacturers will probably take advantage of the threatened scarcity and will advance prices at least to that extent.

Plumbers' Brass Work.—The recent failure of one of the largest manufacturers of Plumbers' Brass Goods has had the effect of stiffening the market for this class of goods. It is said that low prices were the cause of the failure of this concern, and it is also claimed that there is not a manufacturer of Plumbers' Brass Goods who has made any profit on his product for the past two years. This, we are informed, is due entirely to the disagreements between members of the Association of Manufacturers of Plumbers' Brass Goods. Unlike the members of the other associations in the metal trade, the members of the Brass Manufacturers' Association seemed to distrust each other and to have a lack of confidence in themselves. The large manufacturers tried, by making low prices, to drive the smaller manufacturers out of the business, but as the smaller manufacturers were so many and the variety of their wares was so great, in the end some of the large manufacturers had to succumb. The smaller manufacturers can operate their plants at a much less cost than can the large ones. Each plant makes a limited number of articles and each article is manufactured in large quantity. They can set their machinery to make a large run on a particular size and kind of article and do not have to change to any considerable extent, and in this way they can run their plants more economically and with a cheaper grade of labor than can the manufacturers who have large, cumbersome plants in which every variety of apparatus and device used by the trade is manufactured.

Radiation.—The American Radiator Company of Chicago, under date of July 13, announced to the trade that they had that day advanced prices 5 per cent. on all Direct Radiation manufactured at their Standard, St. Louis, Steele and Elwood plants, and 2½ per cent. on Ideal Steam. The company state that new discount sheets will be furnished promptly on application. The United States Radiator Company, Dunkirk, N. Y., under date of July 17, sent the following notice to the trade: "On Saturday, July 20, new prices will be effective on our entire line of Radiation. Orders accompanied by specifications mailed up to midnight Friday, the 19th, will be accepted at present prices."

Pumps.—The market for Cistern Pumps, Pitcher Spout Pumps, &c., is in a much better condition than for some time. The arrangement recently entered into by the manufacturers by which advanced prices have been established is said to be working satisfactorily. Present prices are represented by the following discounts:

Cistern Pumps, Iron.....60 %
Pitcher Spout Pumps, fitted for Iron Pipe.....75 %

The manufacturers refer to the prices which have recently been ruling as unremunerative, and allude to the condition of the market as justifying the advance which has been made.

Shot.—The Shot market is characterized by more regularity than for some time, and the base price of $1.50 for Drop Shot up to B is announced by substantially all the manufacturers. The combination which has been formed is referred to as in excellent control of the market. A trade discount on ton lots of 5 cents per bag is made, with 2 per cent. discount for cash in 10 days.

Roofing and Building Papers.—Manufacturers of Tarred Roofing and Building Papers are fairly full of business along the whole line. Prices are in general pretty well maintained, although there is no trouble in getting the goods.

Roofing Slates.—The Roofing Slate trade is enjoying a season of exceptional activity. The demand for Slates shows a material increase over former seasons and is well distributed throughout the country. Stocks, both at the Pennsylvania and Vermont quarries, are light and in some grades of Slates there is something of a scarcity. Dealers are unable to obtain prompt shipment of orders and find difficulty in supplying the wants of their customers. Prices are firm all along the line. The agreement between the Pennsylvania manufacturers is being strictly maintained and the Vermont quarrymen are also holding up their prices firmly. A slight advance was announced last week in the price of No. 1 Albion, otherwise quotations have not been changed since the last general price-list was issued in May.

Tinware.—The strike in the Sheet and Tin Plate mills if of long continuance is likely to seriously embarrass the manufacturers of Tinware, Japanned Ware and other Sheet Metal goods. Some concerns in this line are already refusing to receive carload orders and will take only orders for small lots subject to the condition of their stock. Stocks of Sheets and Tin Plates are small, and with the prospect of a large portion of the productive capacity being cut off, the outlook is decidedly serious. Prices, under the circumstances, are very strong, with every chance of advancing in the near future should the strike continue.

Wire Nails.—Some improvement in the local demand for Wire Nails in New York has been noticed during the week. Quotations are firm at $2.60 per keg for small lots from store.

Cut Nails.—The New York Cut Nail market is somewhat firmer, the minimum price being referred to as $2.18 per keg from store. Prices range from this figure to $2.25, according to customer and quantity.

Wire.—The demand for Plain Wire continues large and the mills are still considerably behind in deliveries. Prices are firm and unchanged at 2.60c. per pound for Plain Wire and 3c. for Galvanized.

White Lead.—The demand for White Lead in Oil is comparatively light, both on account of the season and

the high price of Linseed Oil. No change in quotations has been made, but some irregularity in prices is reported in the case of large orders. Small lots of White Lead in Oil are quoted at 7 to 7¼ cents per pound.

Linseed Oil.—The price reached by Linseed Oil is the highest for a number of years, and there are intimations of a further advance, but this rumor is not officially confirmed. There is little Oil offered for sale outside of the controlling interests. The demand is confined to orders for immediate requirements and is growing somewhat smaller. With the advent of the new crop of Flaxseed it is anticipated that lower prices for Oil will rule. City Raw Oil is quoted at 83 to 84 cents per gallon in a retail way. Boiled Oil is 2 cents per gallon advance on Raw.

Spirits Turpentine.—The local market has been quiet during the week, with a comparatively light demand. Prices for Turpentine are steady, small lots being quoted at 38 to 38½ cents per gallon.

New Publications.

HOUSE CHIMNEYS. Published by the David Williams Company, 232-238 William street, New York. Price 25 cents. Size, 5½ x 7¾ inches. 62 pages; 40 illustrations.

Not infrequently the stove dealer, furnaceman, or steam and hot water heating contractor has trouble with the apparatus connected with the chimney, either owing to constructive defects or faulty connection. In the absence of a sufficient experience to aid in determining the cause of the difficulty, much annoyance to customers and loss of time and money is sometimes experienced. With a view to furnishing aid under such circumstances the book, "House Chimneys," is presented. It contains a number of articles treating of the construction of chimneys and the results that invariably follow the little defects and want of care in the arrangement of flues and the connection with them of the smoke pipes. These articles have appeared in *The Metal Worker*, and the demand for them, as a result of the excellent information they contained, has led to their presentation in pamphlet form. The various articles contain just such information on the principles governing the construction and operation of chimneys as will enable those who meet trouble to form, on general principles, some idea of the cause of the difficulty, so that they may apply a remedy adapted to the cause. One of the articles describes devices for lessening the strength of the draft, and a formula and tables are provided for determining the size of chimney required for a given work with hot water and steam boilers and hot air furnaces. The book also shows various styles of chimney tops adapted for improving defective draft under certain conditions. One article is devoted entirely to chimney tops, defective flues and methods for improving weak chimneys, overcoming condensation in chimneys, and stopping down drafts. Contributions of a number of correspondents in reference to baking in cooking stoves are also included, and the book contains a fund of useful information calculated to assist those who are confronted with difficulties in the line of chimney practice.

The Guggenheim Smelting Company of Perth Amboy, N. J., have a customs protest pending before the Board of United States General Appraisers involving the proper interpretation to be placed upon certain provisions of section 29, act of 1897. As the law stands at present metals intended for reduction here and exportation afterward are permitted to be treated as bonded merchandise. The importers claim that the trade should only be compelled to export 90 per cent. of the refined metal, whereas the Government contends that the importers must export 90 per cent. of what the metals assay when imported. It is said to be impossible to do this with alloys.

THE YOUNGSTOWN FOUNDRY & MACHINE COMPANY, Youngstown, Ohio, contemplate making some large additions to their plant. For this purpose a meeting of stockholders will be held on July 16, at which time the capital stock will likely be increased from $50,000 to $75,000, to provide funds for these additions. The business of the Youngstown Foundry & Machine Company in the manufacture of Rolls and Rolling Mill Machinery of all kinds is growing steadily and the firm have made some large additions to their plant since the initial works were started. It is found imperative, however, to again increase the capacity, in order to keep up with their business.

United States Commercial Agent Johnson of Stanbridge, Canada, reports a discovery for the preservation of wood. The sap is removed from timber, and at the same time it is impregnated with chemicals, to render the wood either fire proof or impervious to attacks of insects or to decay in salt or other waters. Beech wood can be made suitable for railway sleepers or for boot and shoe lasts. If necessary, the impregnating plant can be used at the felling ground. The cost of impregnating is about 2 cents per cubic foot; cost of plant, about $1000.

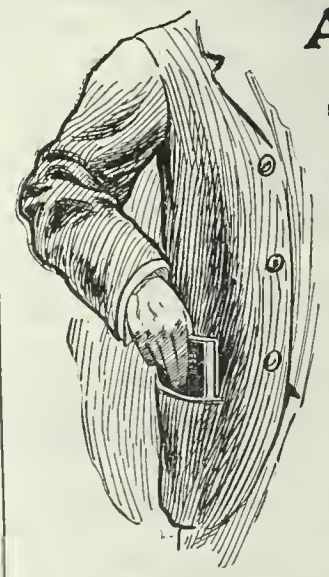
TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION



A USEFUL hand-book for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop.

An elementary manual for the young tinsmiths: A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 ⁘ Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ⁘ Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ⁘ Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, $1.00 Postpaid

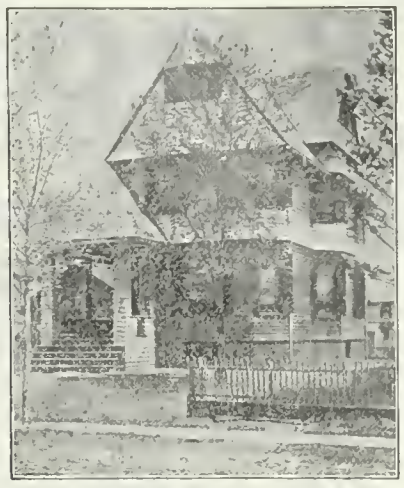
CARPENTRY AND BUILDING

Series No. 2.

Modern American Dwellings

With Constructive Details.



The Most Elaborate and Complete Volume of Plans Ever Brought Out for the Use of Architects, Builders and Home Seekers.

BY NUMEROUS ARCHITECTS.

A selection of thirty-seven designs of artistic suburban dwellings erected in various sections of the country. at a cost ranging from $2,000 to $5,000, and embracing floor plans, elevations and constructive details showing interior and exterior finish, all drawn to a convenient scale, together with brief extracts from the specifications.

Those who contemplate building a home will find this volume of great value. In connection with each design is given the necessary floor plans, elevations and constructive details as will enable any practical builder to execute the work. The plans are diversified in both the interior arrangement and external appearance, and will afford to persons of various requirements an opportunity to select a home suited to their taste and convenience.

33 Half-Tone Engravings. 127 Full Page Plates of Elevations, Floor Plans and Constructive Details. 40 Pages of Descriptive Text. Size 9 x 13 in. (oblong), Handsomely bound in cloth. PRICE $2.00.

DAVID WILLIAMS COMPANY, Publishers, 232-238 William St., N. Y.

SPERRY'S CALDRONS...

TWELVE SIZES ALWAYS IN STOCK.

Full measure, guaranteed perfect, original patterns, with metal distributed where it is needed. Many Caldrons are made from our castings as patterns. They are inferior to original, as they have light bottoms and heavy sides and hold less.

A Few Points About
The Dover Elbow:

No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe.
It is handsome. It is strong. It is the best elbow on the market.

"Nothing Succeeds Like Success."

The *success* with which our *Anchor Ventilator* has met in rendering pure and healthy buildings hitherto stuffy and unwholesome, and in curing chimney after chimney of the *smoking habit—where everything else has failed*—has created so great a demand for it that ere long no building will be considered as finished unless equipped with one or more of them.

We make them of Galvanized Iron and Copper with Metal Top, or, where light is needed as well as fresh air, we furnish them with a *Skylight Glass Top.*

Our Catalogue explains all about this Ventilator and is yours for the asking.

Can't Get Away.

You can't get away from the fact that Berger's "Classik" Metal Ceilings are mighty good ones to handle.

Berger's "Classik" Metal Ceilings and the right kind of a dealer make a winning combination.

"BERGER'S Classik" METAL CEILINGS

help the dealer to get the business because their quality appeals to first-class trade.

The designs are first modeled in clay and faithfully reproduced in the finished material, thus securing the artistic and elegant effect of plastic relief.

The stamping is sharp, clear and well-defined.

Also we have valuable constructional features, reducing the number of joints and making the material easier to handle and to erect.

For up-to-date ceiling material come to us.

Write for our new catalogue. It will give you valuable light on the subject.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

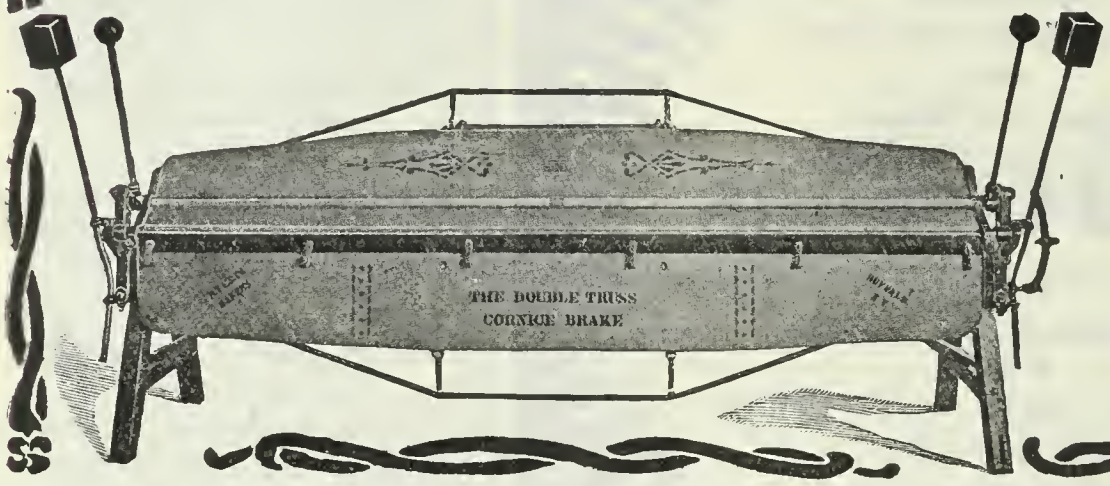
THE DOUBLE TRUSS CORNICE BRAKE.

This is the most practical brake on the market.
It is the most practical because, in the first place, it is lower in price than any other Cornice brake that will do perfect work.
Secondly, because its practical construction enables you to use it to the most profitable advantage.
When you hear about a good thing in your line of business, investigate it. Turn on it the light of reason and consider its money-making possibilities.



Let us send you information regarding our double edge on front leaf, for making fine members and corrugations.

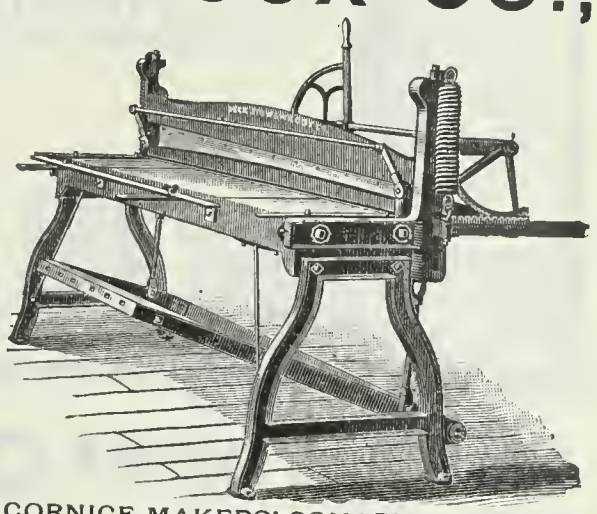
Tinsmiths' Tools of the Highest Grade.

Our *Improved Eureka Cornice Brake.* Will bend No. 20 iron.

96 inches long.



CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 22 iron.
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel, with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

PRICE, - - $35.00.

MONARCH CINDERELLA

FOR HARD COAL.

In the Monarch Cinderella will be found one of the most perfect high grade, medium priced, base burning double heaters offered to the trade.

Every modern and desirable improvement is embodied in its construction. We believe the careful buyer will acknowledge that there is not a better stove in its class.

Every point has been studied to make it the best; and for ingenious, effective simplicity in construction it stands without a peer.

Best Workmanship, Best Materials, Silver Nickel.

We would be pleased to send our catalogues.

Pittsburgh Stove & Range Company,

PITTSBURGH, PA.

WESTERN SALES AGENT, W. D. Sager, 38 and 40 Michigan St., Chicago, Ill.

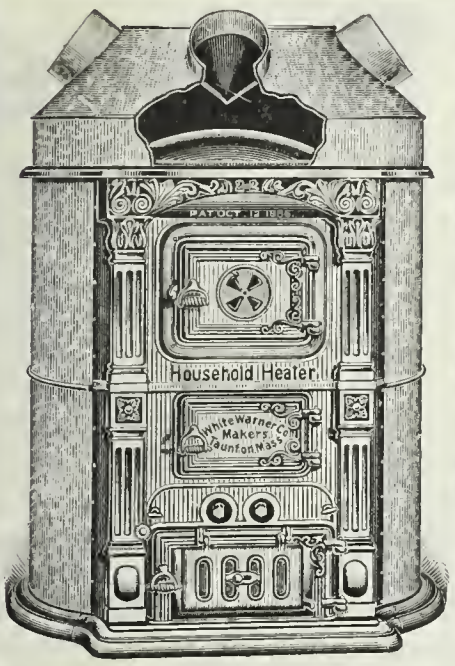
The Monitor Base Burner.

High Art Series.

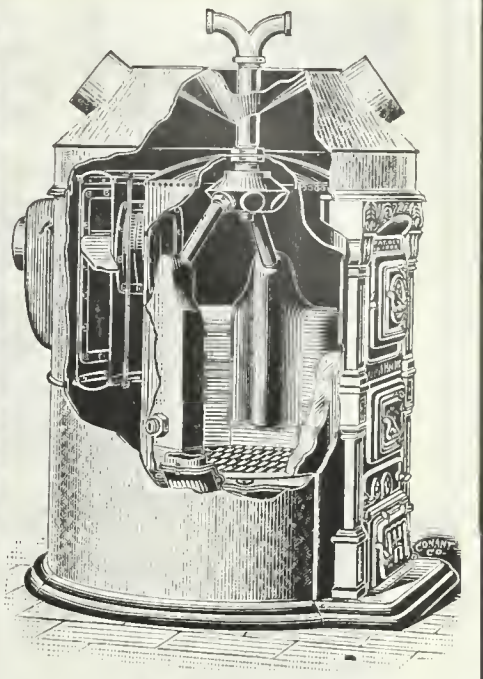
It is without doubt the most powerful heater made and its rich and graceful appearance will attract attention at once The novel construction and distinctive features offer every advantage to the dealer who secures the agency. The diving flue is in front, extending entire width of stove, being what is commonly known as a sheet flue, thus the greatest heat is in the front of the stove where it is most needed. The draft is taken in through the bottom, carrying the heavy foul air which settles near the floor. Grate is of the duplex pattern with outer shaking ring. Two large circulating flues are fitted in rear corners of the stove, affording ample circulation for heating evenly the largest room. Our new catalogue will be out of press on the 17th. Secure the agency at once.

The Wm. Resor & Co.,

CINCINNATI, U. S. A.



A Good Furnace Business for the man who sells the



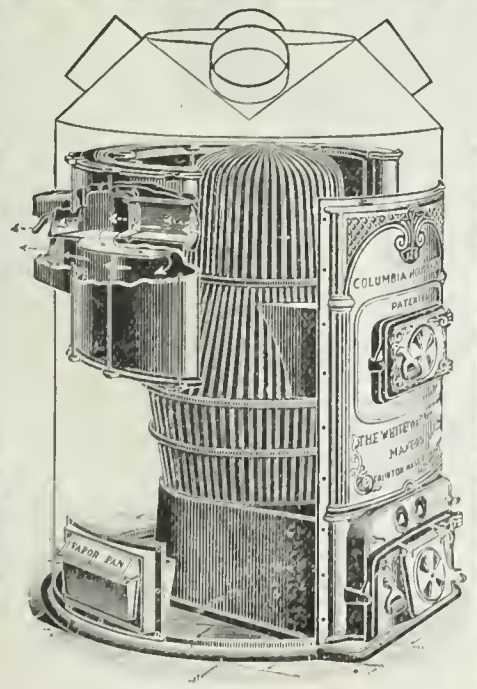
HOUSEHOLD

The man who is agent for The Household Furnace has a "good thing." He gets plenty of work, for he sells the best furnace built.

When a customer wants the best heating system possible, The Household, with its brick-lined fire pot, auxiliary horseshoe radiator, superior grate arrangement, and excellent construction, is almost invariably selected.

The Columbia Household

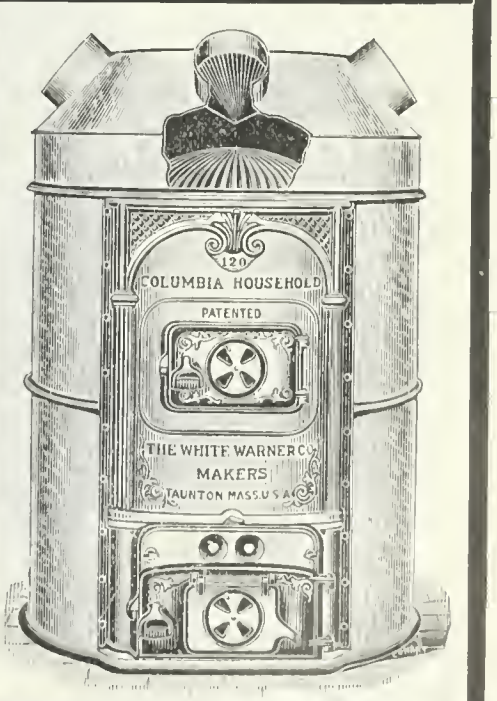
is a new furnace and a popular one—where a perfectly fitted economical heater is desired at a low price. . . .



In addition to the newest features found in cast-pot furnaces, The Columbia Household has ***the patent indirect dratt revertible flue*** of which the White, Warner Co. are sole owners for the New England States.

If you would like to be a Household Furnace Agent write for particulars to . . .

THE WHITE, WARNER CO.,
Taunton, Mass., U. S. A.



Model Steel Range

For Hard Coal, Soft Coal or Wood.

They are **Models** of all the good things, useful and beautiful, that can be embodied in a modern range. Their popularity, on account of their many good points, has led many imitators to copy them as near as they dare, but as the oven doors, dampers, fire-box and other features are covered by patents, the imitations are still behind in the race, so far as construction and operation are concerned, and we feel confident that a comparison will result in a most favorable impression as to our claim that they are **Models of Beauty** and just the one range above all others that it will pay the dealer to handle. The large and constantly growing trade we enjoy on the **Model Steel Range** has been built up purely on its merits and not through a lot of extravagant "fake" advertising.

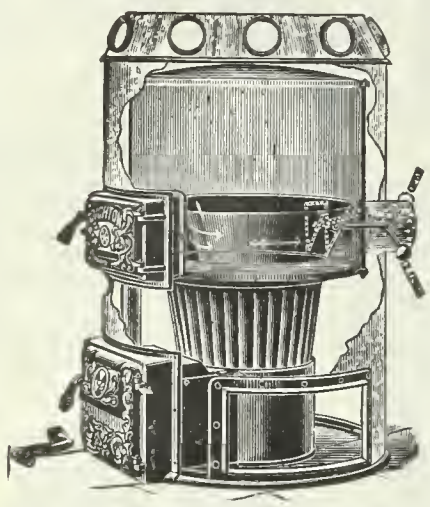
If your furnace business isn't quite as profitable as you think it should be, better see WHY.

Some dealers are now selling a good many "**DIGHTONS**" that didn't think there was any money in the Furnace business.



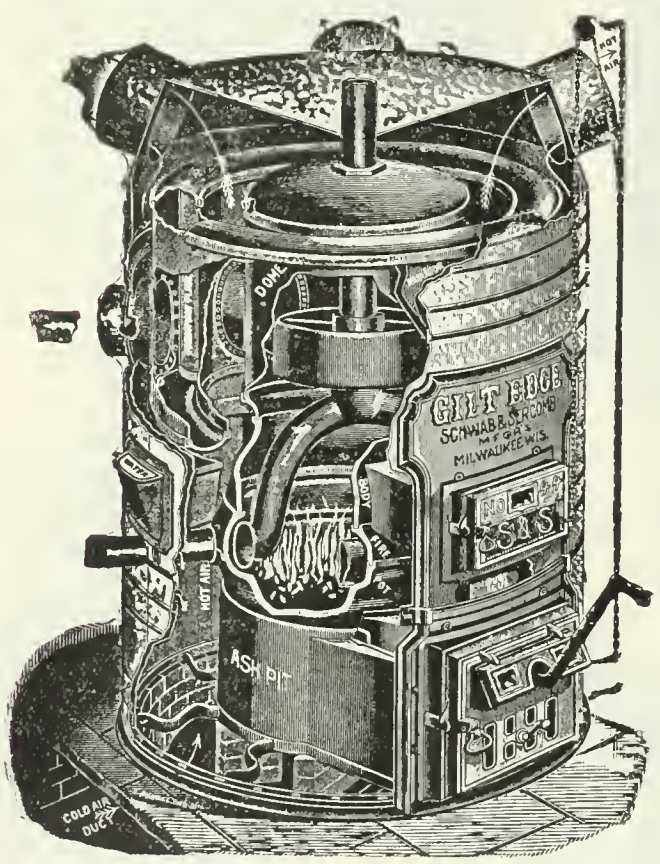
If a dealer figures a Furnace that costs a high price because of an extensively advertised name and don't deliver something that proves more economical in fuel or more durable and satisfactory in every way than the "**DIGHTON**" in the house across the street, this customer naturally wonders why he was it.

The "**DIGHTON**" has advantages over much more expensive Furnaces, especially in the economy of fuel.

If you can prove this by some one who has used a "**DIGHTON,**" you won't waste so much time figuring jobs you don't get.

If you have never sold a "**DIGHTON,**" let us tell you of some one in your vicinity who is using one.

DIGHTON FURNACE CO., Taunton, Mass.



UTILIZED radiating surface, that is economy Sectional fire pots from 1 in. to 2 in. thick and other parts in proportion, that is durability. Positive gas-tight joints, that is necessary to health. These, with all other improvements for ease of management, are combined in the Gilt Edge Furnaces. They are made for all kinds of fuel, and are the very best.

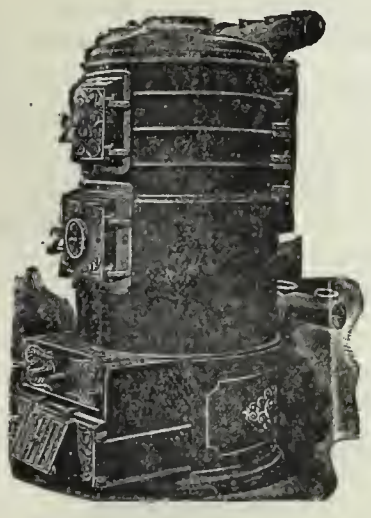
PERSISTENCY.



It was Josh Billings who declared that "if a man saved only a cent a year, it was merely a question of time when he would become a millionaire." You may smile at the remark, but at the same time you must recognize the element of persistency which it contains.

Now that same element is behind every effort made in behalf of

GURNEY HEATERS

"Bright Idea," "400 Series" and "Doric."

It was persistency that made their present excellence possible. It was persistency that secured their present recognition. It shall be persistency which will broaden their already extensive success.

We've a lot of good agents now, but we want more. Better become our agent right away so that these advantages may bring money into your cash drawer.

Our latest trade catalogue, which we will gladly send as soon as you ask for it, contains the whole story. Your address please?

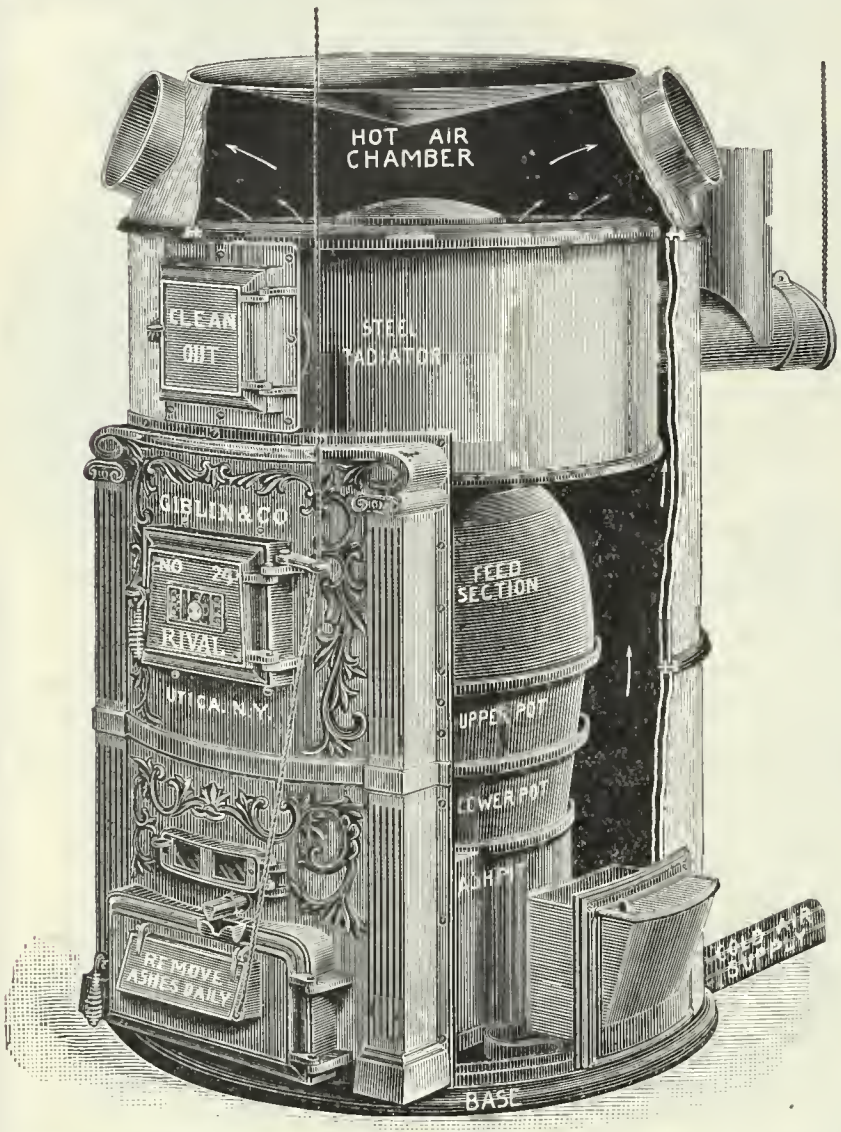
GEO. W. HOFFMAN

FIVE HUNDRED DEALERS

in the United States have sold **RIVAL** furnaces for the past fifteen years and are selling them now. They have allowed other dealers to put in the **CHEAP WORK** and have given their customers



RELIABLE FURNACES

wisely installed and thoroughly efficient in operation. Where **RIVAL** furnaces have been sold the general tone of a furnace business has been advanced to a higher level. Where they have not been sold the furnace business has been in disrepute. Dealers that have had an unsatisfactory business during the past year, have had

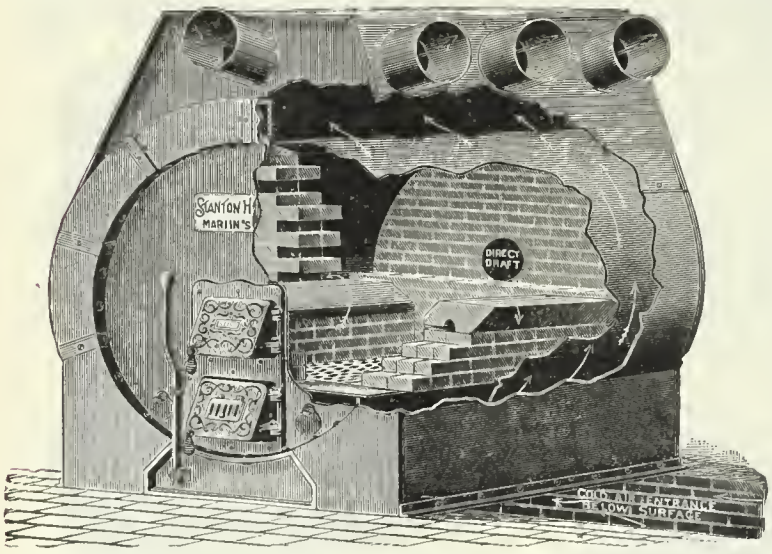
MUCH TROUBLE and LITTLE PROFIT

should consider that possibly it is owing to the character of the heaters they sell. We want good dealers to sell our furnaces, install them in a good manner, and good satisfaction will result with increased business at good profit. Our catalog illustrates and describes the line of heaters we make and on application we will quote right prices.

GIBLIN & CO.,
UTICA, N. Y.

The Stanton Seamless Heater,

PORTABLE CASED.



LOUISVILLE, KY., Apl. 5th, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen :—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly

CLEVELAND, Ohio, July 8th, 1901.

To the Stove Trade:

We believe there is a chance for the consolidation of all, or nearly all, the stove foundries of this country into a gigantic trust.

This concern has not been approached and will not be a part of the scheme.

We shall continue, however, to make patterns for any one having the price. Do you handle a hundred Oak stoves or steel ranges in a year? If so, it will pay you to own your own patterns—get castings from your local foundry and quadruple your profits.

All correspondence confidential. Yours respectfully,

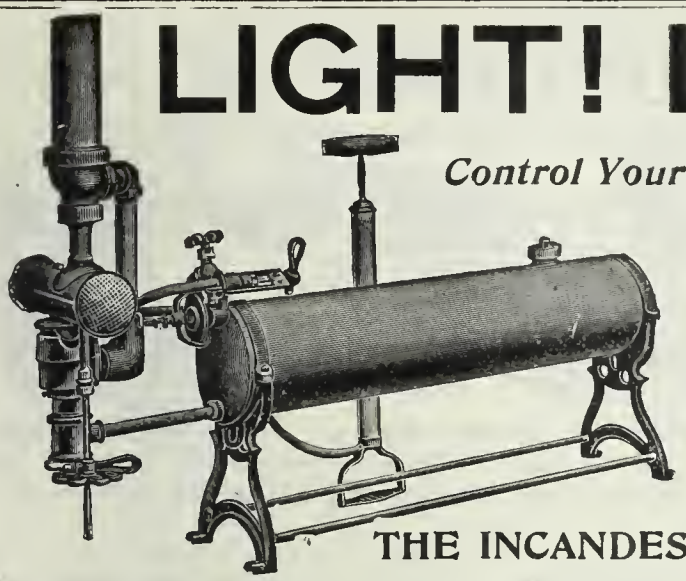
LIGHT! LIGHT!

THE CHEAPEST AND BEST IS
THE AIR LIGHT

Control Your Own Gas Expense.



A radical departure from methods heretofore attempted in illumination. Extreme cheapness and great brilliancy of light, simplicity of operation and durability is the result. As a commercial light it is the crowning triumph of lighting apparatus, costs less than one-half that of gas light or electricity, requires less attention than one ordinary oil lamp. Gives 600 candle power at one-half a cent per hour and is absolutely safe. Thousands of these machines are in daily use and giving perfect satisfaction. Size of average apparatus, 33 x 12 x 12. Any Tinner can put it up. Write for descriptive pamphlet and prices.

JUST PUBLISHED.

Practical Hints on Joint Wiping,

For Beginners in Plumbing.

SIXTH EDITION, ENLARGED.

With an Appendix Giving a Selection of Practical Letters and Articles Compiled from THE METAL WORKER.

66 Pages. 41 Illustrations. Paper, 25 Cents.

This edition contains besides the two original articles on joint wiping, by experts, a selection of letters and articles on various important phases of the subject.

These include the following:

Joint Wiping on Copper Pipe.
Wipe Joints on Brass and Iron.
Wiping Joints on Tin Pipe.
Wipe Joint on Lead and Iron Pipe.
To Make Tight Joints.
Froze the Pipe to Wipe a Joint.
Wiping Joints Without a Furnace.
The Effect of a Jar on a Hot Wiped Joint.
What Caused the Joint to Break?
Strength of Joints in Lead Pipe
Good Wiping Solder.
Durability of Coarse Solder.
Plumbers' Paste.
Cleaning Solder.
What Breaks Wiped Joints?
Hard Solder to Resist Ammonia.

The first article in the book is written by a practical plumber, and is illustrated from photographs representing the hands and tools when wiping joints in various positions. The second, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that is published.

25 CENTS, POSTPAID.

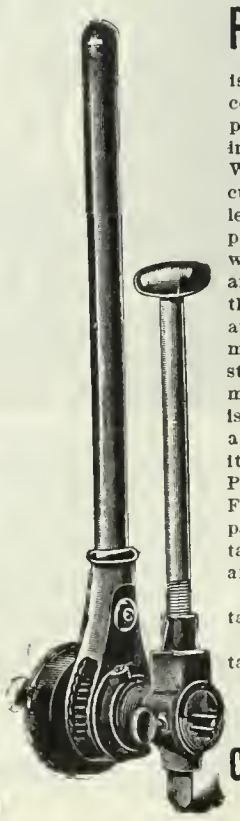
RATCHET STOCK



is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00.

For sale by leading jobbers.

Manufactured Solely by

Exports of Manufactures.

Exports of manufactures from the United States appear to have been slightly less in the fiscal year just ended than the preceding year. The provisional figures issued by the Treasury Bureau of Statistics show an apparent reduction of $14,565,000. This statement, however, is to some extent misleading, because the figures for the fiscal year 1901 do not include the exports to Porto Rico and Hawaii, which were included in other years and which were largely composed of manufactured goods. These aggregate about $25,000,000 for the fiscal year, and if added to the total of manufactured exports to foreign countries, would make the figures for 1901 just about equal to those of the preceding year. In fact, an analysis of the general export figures of manufactures, so far as available, shows in most cases an increase in 1901 over 1900, while the decrease is confined to a few articles and is due in many cases to a fall in prices rather than to a reduction in quantity. This is particularly true of the exports of illuminating oils, which, while showing a decrease of four and a half million dollars in value, actually increased nearly 50,000,000 gallons in amount. The two other principal manufactured articles in which exports show a decline in the past year, as compared with 1900, are copper and cotton manufactures, the reduction in the latter being entirely due to temporary conditions in China, where the war caused a material falling off in the demand for cotton and cotton goods. The decrease in copper exports was only in comparison with the preceding year, when a phenomenally large amount of the metal was sent abroad. As a matter of fact the exports of copper in 1901 were far larger than those of any former year, excepting 1900. In a larger number of articles the figures of 1901 showed a marked growth over those not only of the preceding year, but of any former year, particularly in iron and steel manufactures and machinery. American manufacturers, therefore, have no occasion for anxiety regarding the slight apparent decrease in the export figures of manufactures for 1900.

Aerial Navigation.

If the circumstantial accounts cabled from Paris can be fully credited, there seems but little room for doubt that the problem of aerial navigation is in the way of practical solution. Last week M. Santos-Dumont, a young Brazilian who has devoted a large amount of time to the study of aeronautics, succeeded in navigating an air ship constructed under plans of his own invention across Paris and around the Eiffel Tower, returning with ease and safety to the point of departure in the suburbs of the city. This performance he duplicated a few days later, making a journey from the Longchamps race course around the tower and back to Longchamps in 50 minutes, under the auspices of the Aero Club. Santos-Dumont's balloon is described as constructed of light material, about 150 feet long and 40 feet at its greatest width. Beneath the balloon, suspended by thin steel wire, hangs a cradle 50 feet long, composed of light pine sticks bound together with aluminum, containing a four-cylinder motor of 16 horse-power. Suspended from the center is a triangular cradle in which is a screw, the flanges of which are 12 feet wide, and which revolves at the rate of 200 turns a minute. The aeronaut sits in a small basket at the opposite end, controlling the rudder and the valves of the motor by lines. In the course of his experimental trip M. Santos-Dumont, it is asserted, was able to steer his vessel through the air in every direction, north, south, east and west, turning to the right and to the left, ascending and descending as easily and gracefully as a great bird, both with and against the wind. It would seem from the accounts available that the Brazilian's aeronautic performances are as much in advance of those of Count Zeppelin's and other accomplishments in the same line as those surpassed the ordinary ballooning. That he was able to navigate his vessel in the air as readily as a steamship is navigated in the water presents a conclusive proof of the value of his achievement in aerostatics. The claim made long ago by enthusiastic aeronauts that men would be navigating the air in the twentieth century seems to have come within appreciable distance of consummation, even earlier than was generally expected.

The Drought.

Another week of excessive heat in the central valleys of the country and the middle Rocky Mountain section has intensified the previously existing drought and enlarged its area. News from Kansas, Missouri, Nebraska and Oklahoma proves that the heat has been disastrous to the early corn crop, while the corn crop in the Middle West is likely also to prove a failure should abundant rains fail to come within the next week or so. While it is probable that the crop scare has been largely engineered for purposes of speculation in the Eastern markets, there seems to be no doubt that the situation of the farmers in the West is becoming a serious one. Exhaustive estimates gathered by the New York *Journal of Commerce* this week from all the farming sections affected by the drought indicate a loss of more than 300,000,000 bushels of corn as a result of the unfavorable weather conditions. The State of Kansas, that within the last few years has profited so materially from its abundant crops, appears to be the greatest loser. Not only is her corn crop likely to be materially cut down, but she has suffered from a short hay crop, owing to the drying up of the pastures. This has also affected the live stock of the State. The loss of cattle, it is feared, will be serious. There is still room for hope that copious rains may change the situation in regions where the damage has not reached a des-

perate point, but there seems little doubt that in a large proportion of the corn belt the damage already done is beyond repair.

One Possibility of the Great Strike.

It may be a little early to speculate on the result of the contest now on between the United States Steel Corporation and the Amalgamated Association, says *The Iron Age*. Strikes or labor troubles are uncertain matters, it being difficult to determine when they start whether they will be of short duration or extend over a long period of time. Some strikes can be easily gauged at their beginning because of the weak condition of one side or the other. In this case both sides seem to be well equipped to conduct a long struggle. Special considerations may, however, induce one or the other of the parties engaged to quickly make overtures for peace. In view of the important interests involved and the great amount of injury that can be done not only to those immediately affected, but also to a very wide circle of business connections, it is to be hoped that the struggle may not continue for a long time, but that it will be brought to an early termination.

A strike lasting three or four weeks would not be a very serious matter, as it would merely mean the ordinary summer vacation. It would probably simply result in an accumulation of business, which would keep the mills very busy for some considerable time in the effort to catch up with orders. This would make the fall months active and would probably subject no one to great inconvenience. Should the strike continue for three months, or as long as the labor troubles in the same mills continued last year, it would mean the cutting off of a very large part of the supplies necessary for great manufacturing consumers, who need to operate their works actively for some time to come in preparing for fall and winter requirements. This would be unfortunate for many interests concerned, unless arrangements could be made for importing large quantities of necessary material from abroad. It is not believed that a sufficient supply could thus be obtained, as foreign manufacturing establishments are hardly in a position to turn out great quantities of what would be needed here on such comparatively short notice. And, further, it would require considerable nerve, not to say recklessness, for any consumer to place orders abroad for large quantities, as he would face a probable loss if the strike ended before such purchases were marketed.

The result of a long stoppage, it is now reasonable to suppose, would be of a similar character to that which was experienced on the reopening of the bar, sheet and tin plate mills last fall after a shut down of three months. Stocks of manufactured goods will be so completely exhausted, and the supply of rolling mill products so much in arrears in meeting the requirements of the country, that the manufacturers will again find their facilities taxed to the utmost for months afterward. In that event the easing of prices anticipated from the steady increase of producing capacity will be postponed. If the strike should be extended to other plants controlled by the United States Steel Corporation, as threatened by President Shaffer, the effect on the iron and steel markets will be still more pronounced.

It is a mark of breadth of view that the National Retail Hardware Dealers' Association, as reported elsewhere, declines the suggestion that manufacturers and jobbers should contribute funds to aid it in carrying on its work. The association is wise in preferring to maintain an independent position. Contributions given in the way suggested might be an embarrassment in determining questions relating to trade practices and abuses and the proper method of meeting them. Contributions from those outside of the association would have a tendency to bias judgment and prevent the openness of mind and freedom of action which are essential to the carrying on of the important work which retail merchants are called upon to do for their protection and advantage. For certain of these abuses both manufacturers and jobbers are doubtless responsible. A dignified and independent attitude in a matter of this kind will meet with general approval and command the respect of the trade.

One point has not, so far as we have observed, been brought out in the discussion of the advantages and disadvantages of the great modern consolidations. It is that full employment of the plants does not mark the point of minimum cost. All the consolidations count among their works establishments poorly equipped, antiquated and inefficient. When the demand forces these into activity, or, in other words, at the period of maximum production, these works must be run, in spite of high cost. The lowest cost is reached when only the best plants are in operation. It may happen, therefore, that a consolidation may make more money, even under a slight reduction in prices, when its output is below the maximum.

The foreign trade returns of the United States for the fiscal year just closed make a remarkable record. It was expected that the exports of merchandise for the 12 months would round out an even $1,500,000,000. The figures up to June 1 left little doubt that this would be the case, but the exports during the month of June showed a sharp falling off, leaving the total value of exports for the 12 months at $1,487,656,544. This is a remarkably handsome showing, however, considering that it is nearly a hundred million dollars more than in the previous fiscal year, which itself made a record. An interesting fact in this connection is that for the first time the exports from this country during the year have exceeded those of Great Britain. Had the shipments to Porto Rico, Hawaii and the Philippines been included in the latest returns among our foreign trade, the total would have reached the $1,500,000,000 mark, but the countries named are now included among domestic consumers.

Many novel methods of moving buildings have been adopted in various parts of the country in order to meet local conditions and circumstances, but among the most curious ways of doing work of this kind is that of utilizing barges or flat boats to float buildings across stretches of water. One case of this kind occurred not long ago in Pittsburgh, and a later one is that at San Francisco, where a man, having constructed a small hotel, desired to move it to a lot which he had secured at Benicia. The house was first moved to the wharf and when the tide was right was pulled onto a barge by means of a horse windlass, after which the barge was towed to Benicia by a river steamer.

In Italy a new antidote for labor disturbances has recently been inaugurated in the form of an antistrike league, the membership of which is composed of workmen of the Roman Catholic faith. The watchword of the league is: "Freedom of action and the right to work." The leaguers are reported to have already achieved a notable victory at Genoa, where a number of them took the places of striking coal heavers and kept at work in the face of threats and actual violence.

New Yorkers are probably the most nomadic citizens in the world. At any rate, they change their abodes oftener than any other people in this country. Recent statistics show that 65 per cent. of the inhabitants of Gotham move about every year.

LOCAL STOVE ASSOCIATIONS AND PRICES.

Local associations among stove manufacturers have been in existence more or less for many years and the good or evil they have accomplished is a matter of history. As some people would sum it, "they were complete humbugs and no good except to further the plans of some schemers, &c., who were using the other members for their own personal advantages." Others were always in favor of association and endeavor faithfully and honestly to carry out all measures enacted in an upright and conscientious manner, but it is very discouraging to such people to see many not so scrupulous, working all things for their own personal advantage, regardless of their solemn pledges and agreements made in their meetings.

It is not necessary to dwell upon these unpleasant features, but it can be emphatically stated that organized bodies of business men are going to control and shape the policy of profit making in business, for that is the object of business, and all progressive and studious men are devoting their spare moments to this subject and are looking for the right way, as well as the best way, to secure them. It may be added that these people are not given to the study of one side only of the question, as they fully recognize that the other side demands and exacts its share of their attention.

It can be safely stated that the opponents of local organizations believe that they can overcome all their competitors or, in brief, secure their share of the profits, by pursuing their own course, or, to use the cant phrase, "We run our own business." If the object of the concern is to do business, they can do it on this plan; but if it expects to make profits it cannot be done that way. Selling goods at cost means no profits; selling goods less than cost is a dead loss, and when you boil down all the objections to associations it is compressed in about one formula, "We have got the capital and we can sell the goods as cheaply, if not cheaper, than others."

There is no mystery in stove making, and experienced makers can judge of any others' costs. No one can deceive the other and prices at which goods are sold are an open book; "confidential" prices are absolutely public, and every traveling man gets his opponents' latest "confidential." In short, while it has been more or less the policy to buy and sell goods under cloaked conditions, publicity is the rule these times, and a sale of almost any kind is public about as soon as the price has been made.

A local organization in one of the large cities which was very successful in maintaining prices and making money for all some time ago are now at sword's points and, with the help of dealers, builders and others, are presenting consumers with the finest goods that can be made for about cost or less than cost and apparently are quite happy over the matter; but the balance sheet at the end of the year will be sure to have the misery column stacked up if it is continued.

It seems that it would pay to keep up local associations, and if an independent salaried official or secretary was maintained who could devote all his time to its interests, it would prove a much better investment than selling goods for cost. Stove dealers are not benefited by cut prices or fluctuating ones as a rule, as whatever they get on reduction is passed over to the consumer, who does not appreciate it, nor does he buy one more stove on account of it.

The Pittsburgh Stove & Range Company

of Pittsburgh, Pa., have just issued Supplement No. 1 to Catalogue No. 43, relating to Cinderella ranges and heaters. The leading steel range shown is the Cinderella Special, which is said to embody every practical improvement known in steel range making. The outside construction is polished, annealed and patent leveled, blued steel of No. 18 gauge, while the inside is of cold rolled steel of No. 14 gauge. All parts that are exposed to the direct action of the fire are of double thickness, with an asbestos millboard between, all securely riveted together in a workmanlike manner. The ovens are made of No. 14 gauge wrought steel, the top oven plate being fully protected from the action of the fire, while the bottom oven plate is supplied with cast iron braces to prevent buckling. The fire box is of large capacity, the fixtures being interchangeable for all sizes. Three kinds of grate can be supplied—the duplex, the flat bottom and shaking, and the wood grate. The top frame of the range is cut in four sections to prevent cracking and warping. The oven door is balanced and provided with a gravity handle, and the base is ventilated, which feature, it is claimed, removes any possibility of overheating the floor. Attention is called in the supplemental catalogue to the Junior Cinderella Oak, a neatly designed stove for hard or soft coal or wood, made in four sizes, of attractive exterior. Another specialty is the Forest Cinderella, a sheet iron construction designed for burning wood as a fuel. This is made in four sizes and has a capacity for taking wood in lengths ranging from 18 up to 25 inches.

Good Service by the International Heater Company.

The International Heater Company of Utica, N. Y., are favoring their friends in the trade with a very neatly printed pamphlet entitled "Good Service." It tells something about their facilities for manufacturing high class goods, and also points out the fact that over a half century's experience has taught the company how to properly meet the wants of those requiring heating apparatus. As the company put it, the pamphlet is intended to convince the reader that they have every manufacturing, warehousing, shipping and office facility for giving good service. Heaters of almost every conceivable style are furnished, and in order to set the merits of these goods properly before the trade the company publish nine separate illustrated catalogues and six price-lists. In fact, their very latest catalogues, from which all obsolete patterns have been eliminated, show 395 styles and sizes of heaters.

The company have a New England depot located at 198 Spruce street, Chelsea, Mass., which they point out is "something more than a desk and a 'phone." It is, in fact, a substantial, commodious warehouse with an office annex, and is accessible by either steam or electric cars, being 20 minutes' ride from the business center of Boston. Large quantities of repairs, carefully fitted and finished, embracing grates, fire pots, ash pits, radiators and smaller parts in almost endless variety are here carried in stock. Scattered through the pamphlet are half-tone illustrations of some of the leading lines of heaters manufactured by the company, also interiors of different departments of the works.

An Old Cook Stove.

Allen W. Williams, secretary and treasurer of the Pioneer Stove Company, who are an outgrowth of the Gill Stove Company, Columbus, Ohio, has recently secured, after considerable correspondence, a stove made by John L. Gill something over 60 years ago. At that time the Gill works were located near the spot where the Columbus City Prison now stands, and the store in question was among the first "down draft" constructions made. There was at one time a long litigation in the courts regarding the patents on certain parts of the stove, but the matter was finally settled in favor of the Gill Company. The "hot air" stove was originally made to burn wood, the places where the lids are now usually found being covered with gridirons.

The stove was purchased by J. S. Leedon of Bellefontaine, who in a letter notifying Mr. Williams in regard to the matter stated that the lady from whom he bought the stove had it for 60 years, and it was second-hand when she purchased it. Out of curiosity Mr. Williams wrote George W. Gill on this point and in reply received the following:

"The stove referred to was manufactured by my father between 1838 and 1842. I remember seeing such stoves in the scrap heap, but never saw a new stove of the make. The character of the material is evident from its durability."

THE WESTERN OIL AND GASOLINE STOVE TRADE.

The trade this season in oil and gasoline stoves has been unusually heavy. This is due to two causes. The advertising done by the Standard Oil Company has undoubtedly had a strong influence. The company have advertised extensively in local newspapers and magazines, calling attention to the advantages of oil and gasoline stoves for summer cooking. without alluding to any one line of stoves. This has led many people to visit hardware stores and inquire into the special features of such stoves. Bright and wide awake salesmen have not failed to take advantage of this increased interest and have made good sales. The extremely hot weather has been another strong influence which has helped the trade, but unquestionably it has been greatly assisted by the advertising done by the Standard Oil Company. It is further stated that the export trade has been greatly stimulated by the advertising abroad done by the same corporation. One Western manufacturer recently shipped a single order to a foreigu buyer comprising three carloads.

Some delay in the delivery of oil and gasoline stoves is now being caused by the shortage in the supply of steel sheets. due to the strike in the sheet mills. Some of the stove manufacturers have been badly caught by their inability to lay in a large stock before the strike began. It is stated that thousands of stoves are lying in factories unfinished, waiting for the sheet steel parts. This causes great inconvenience. and unless the strike is soon settled will mean much financial loss to the trade. The stoves must be made up quickly to be sold to consumers this season. If they have to be carried over to next year it means the locking up of a great deal of capital.

Monogram Stoves and Ranges.

The Quincy Stove Mfg. Company, Quincy, Ill., favor us with a copy of their new catalogue, showiug the large line of stoves and ranges which they manufacture under the Monogram trade-mark. The catalogue comprises 85 pages and is substantially bound in a flexible muslin cover of maroon color bearing a highly decorative design in silver. The distinctively new goods shown in this catalogne are the Matchless Monogram steel range, the Art Monogram steel range, the Home Monogram cast range and the Novel Monogram upright Todd stove. The Matchless Monogram is a handsomely designed steel range having a body of Wood's planished steel, lined with asbestos mill board, a heavy cast base skirting, a profusion of nickel trimmings, pouch feed, end feed for wood or coal, spring balanced oven door and full cast reservoir. It is made in six sizes and in all styles.

The Art Monogram is also of pleasing design, but less elaborately decorated, and is furnished in eight sizes and all styles.

The Home Monogram cast range is a fine specimen of the molder's art, the doors, skirting and high shelf being enriched with bold designs in scroll work. Style A has a solid cast base and style B is mounted on legs connected by an ornamental skirting. This range is made in six sizes. The Novel Monogram upright Todd is made in two sizes, for wood only, and is so coustructed that the heat circulates between the linings and the ornamental jacket in the same manner as in the horizontal Todd. This is a novelty in Todd construction and is expected to prove popular.

Other products shown are the Prize Monogram steel range in eight sizes, the Prize Monogram steel cook in six sizes, the Pride Monogram steel range in eight sizes, the Pride Monogram steel cook in six sizes, the Jewel Mouogram cast range in six sizes, the Comfort Monogram cast range in seven sizes, the Famous Monogram cast cook in six sizes, the Quincy Star cast cook in five sizes, the Leader Monogram cast range in six sizes, the Birch Monogram cast range in seven sizes, the Maple Monogram cast cook in six sizes, the Quincy Comet cast cook in five sizes, the Monogram and Quincy oaks each in six sizes, the Junior Monogram and Quincy Boy Oaks each in three sizes, the Quincy Peerless hot blast coal heater and the Quincy hot blast coal heater each in two sizes, the Quincy Beauty and the Quincy Faultless wood heaters each in two sizes, the Bi-Me Monogram wood heater in two sizes, the Raven air tight for wood and the Topsy coal heater with top cooking holes in two sizes.

THE STEEL STRIKE AND THE STOVE TRADE.

It will not surprise the knowing ones in the stove trade to see the prices of oak stoves, steel ranges, steel cooks and other goods made largely of steel sheets advanced sharply in the near future. The stock of steel sheets throughout the country is quite light, while the production has been heavily cut down by the strike in so many of the mills of the American Sheet Steel Company. The stove manufacturer is very lucky indeed who succeeded in securing deliveries of sheets in such quantities that his stock will enable him to continue to make up goods and supply his customers. From present indications the strike is likely to continue for so long a time as to considerably embarrass the trade.

Champion Monitor Steel Ranges.

We have received from the William Resor & Co. of Cincinnati, Ohio, a copy of a neatly printed pamphlet of 20 pages, illustrating and describing the Champion Monitor Steel Ranges. which are made in varieties adapted to meet the usual requirements. The stoves are of handsome exterior, with an amount of nickel employed to make a pleasing contrast with the black surfaces. Four sizes of body are made, those of the full nickel line being of Wood's planished steel, closely hand riveted, and lined throughout with asbestos, which serves to retain the heat where needed, while at the same time preserving the steel. The bottom of the oven is made in two pieces, flanged and very closely riveted, the work being done in such a way as not to retard the draft and at the same time prevent the bottom of the oven from warping or buckling. The company point out that one set of linings and grates will fit the fire box of all sizes, and that the grates can be removed through the front without disturbing the linings or the water heater. The company use their own reversible combination coal and wood duplex grate, which is well adapted for all kinds of fuel, and they furnish when especially ordered an extension fire box for wood. The smoke box and reservoir casings are made of cast iron, which, it is claimed, is not subject to the action of creosote, hence will last a lifetime without requiring repairs. The oven door being balauced is easily operated, and when let down forms a commodious oven shelf. The pamphlet shows the Champion Monitor combination coal and gas range in nickel finish, also the Monitor gas range, a special catalogue of which the company will send to any dealer on application.

Increasing Furnace Trade.

Many heating contractors still confine themselves to furnace work, and notwithstanding the increased competition in the heating field which has come from the wider introduction of steam and hot water heating and the advantages which these systems have for buildings covering a large space of ground they find no difficulty in showing that a furnace heating system has many peculiar advantages. At the same time, those who make a specialty of furnace work find it necessary to adopt various schemes to attract the attention of possible customers. and to render a furnace system of heating inviting to those who study its advantages for providing a pure and comfortable atmosphere. The arrangement of hot air furnaces in a show window with registers, tin pipes and elbows has been so general with the trade that instead of attracting attention it is apt to be passed by unnoticed, although displays of this character when made with some originality have much to recommend them.

The method of interesting possible buyers adopted by the Bedford Heating Company of Brooklyn, N. Y., who

sell many of the Kelsey warm air generators, made by the Kelsey Furnace Company of Utica, N. Y., is something of a departure from the ordinary practice and it has the merit of novelty. The company have made a neat display in one of their show windows of the complete plans of a residence which they have heated, on which are the working drawings of the furnace heating system, and in connection with the drawings is shown a fine photograph of the building heated. The building is a handsome residence of one of their customers and makes a very pretty picture, which in itself is enough to catch the eye of the passer by. The plans have been especially prepared and clearly show the heating system. This method of bringing furnace heating before those who own property is well adapted to the present time. The ability to read and understand architectural drawings is possessed by many more people at this period than ever before. Such an exhibit cannot fail to make a good impression on this class of buyers, and there are many furnacemen who will find little difficulty in making a similar display. The example set is worthy of being widely followed, particularly as the season for furnace work will soon be at hand.

ODD PLATES.

THE A. & J. MFG. COMPANY of Gadsden, Ala., have been organized, with a capital stock of $10,000, by Otto Agricola and others, for the purpose of manufacturing Stoves, Hollow Ware, &c. Otto Agricola is president of the concern and E. S. Jones, E. P. Smith and J. G. Ewing directors.

WESTERN advices under date of July 20 are to the effect that a deal was closed on that day by which the Ferris Stove & Mfg. Company, for many years located in St. Louis, and who were recently heavily damaged by fire, will locate in Terre Haute, Ind.

WILLIAM RESOR & Co. of Cincinnati, Ohio, refer to the Monitor base burner with front sheet flue which they introduced to the trade last season as admirably adapted to the use of hard coal and as most powerful in operation. The general construction is the same as that used in their Monitor parlor wood base heater and offers, they claim, every advantage to the dealer securing the agency of the stove. The diving flue is in front, extending the entire width of the stove, being what is commonly known as the sheet flue. The draft is taken in through the bottom plate, carrying into the stove the heavy foul air which generally settles near the floor. After passing through the bottom plate the air enters the draft box or distributer, from whence it is passed under the grate throughout its entire width. The grate is of the duplex pattern with outer shaking ring. The bottom flue encircles the draft box, thus heating the air before it reaches the fire. The firo pot is large and the arrangement is such that the fire is under complete control at all times. Two large circulating flues are fitted in the rear corners of the stove, thus affording ample circulation of air to uniformly heat the room in which the stove may be used.

THE PITTSTON STOVE COMPANY of Pittston, Pa., are about putting on the market a new Range which will be known as the Colonial Happy Thought. A leading feature will be an improvement in the duplex grate, while another will have to do with the flue construction. The design is attractive and the company feel confident the new range will meet with wide popularity. They are also arranging to have a new line of Parlor Stoves ready by the time the season opens.

JOSEPH H. GIARTH has leased the foundry and machine shop at Altoona, Pa., formerly operated by J. W. Bain, for the purpose of manufacturing a line of Hot Air Heaters and other heating appliances which he has invented.

THE J. W. PAXSON COMPANY, Philadelphia, continue very busy, some recent orders including a complete foundry equipment, cupola, ladles, &c., for export to Cuba. They are also furnishing the American Sanitary Company, Elizabethport, N. J., a full foundry equipment, including a No. 16 Paxson-Colliau cupola, sand blast machinery, cranes, blowers, rumblers, &c.

THE MICHIGAN STOVE COMPANY are supplying their agents with beautifully designed transfer papers to be used on glass. One is intended for a store door and bears the time-honored request, "Please close the door." Another is to be used on showcases, and tells the reader, "Don't lean on the glass." The Garland trade-mark is used as a decorative feature. The company are also distributing circular stickers showing the Garland trade-mark, which are ready gummed so that they can be attached anywhere for advertising.

THE COOK & VAN EVERA COMPANY, Chicago, have enjoyed a better trade this season in Oil and Gasoline Stoves than in any previous year. The season opened a little late, but orders have come in so fast and for such quantities as to make up for it. They have found the trade in cast goods not running particularly heavy, especially cooking goods, but their Furnace business has never been better. They are agents for the Kelsey Furnace, and their inquiries from prospective users are steadily on the increase. D. S. Cook of this company is in Colorado with his family, but the business is ably conducted by D. W. Van Evera, who enjoys the rush of orders.

GEO. M. CLARK & CO., Chicago, have never been so busy in their history as this summer. They are doing the largest business in Gas and Gasoline Stoves and Water Heaters that they ever had. The company took a proper view of the situation when the possibility of a strike in the sheet mills was discussed, and secured such a large quantity of sheets that they are not suffering from scarcity of this necessary material, as are some of their competitors; consequently they are in a position to steadily meet the requirements of their trade. The company will shortly issue their new Heater catalogue.

THE CHICAGO HEATER & SUPPLY COMPANY of 54 Dearborn street, Chicago, are sending to the trade a four-page circular devoted to the new Superior Warm Air Furnace, which is made with the fire pot in sections, with a large combustion chamber surmounted by a top return flue steel radiator. The circular also presents a view of the grate and ash pit, showing how readily new grate bars may be inserted. The furnace is made in four sizes, with fire pots 22, 23, 25 and 28 inches in diameter. The concern are the Western agency of the Utica Heater Company of Utica, N. Y.

The National Retail Hardware Dealers' Association.

We have received the following communication from M. L. Corey, the secretary of the National Retail Hardware Dealers' Association, which relates to a suggestion made by a gentleman prominently connected with one of the State associations that manufacturers should contribute money to aid the National Association in carrying on its work:

While we appreciate the motive that prompted this letter, and he also states this was written without our knowledge or consent, our position on this point was plainly stated in the June issue of the *National Hardware Bulletin*, a quarterly publication sent regularly to every member of all the different States affiliated with the National. It reads as follows:

"It has heretofore and will continue to be the aim of our association to accept no money to carry on our work outside of that contributed by our regular members or those dealers in unaffiliated States who hold honorary memberships. There are many manufacturers and jobbers who would willingly contribute for the advertising this would give them and other purposes not necessary to name, but if we are to succeed we must remain independent and under no obligations to any firm with whom our interests may clash."

We are an organization of retail dealers exclusively, working for the individual and general advantage of our members, representing millions of invested capital, and ought to be self supporting. All concede that general results must be obtained by uniting all organized States and working through one head. Admitting this, then $1, or even $5, each should not be prohibitive.

Some of the manufacturers and jobbers have been trespassing upon legitimate and what should be exclusive retail ground. Others, encouraging and aiding il-

legitimate competition and promulgating new departures, calculated to eliminate the retail dealer entirely. We have been trying to get a better understanding and mend matters on a friendly, mutual interest basis between jobber and dealer. Our attempts have not always met with success, and an accumulation of unsettled complaints must be considered as nearing the point where the road forks.

We believe our contentions are right, and in united effort will win. These are a few of the reasons why the National Retail Hardware Dealers' Association cannot accept aid from any manufacturer or jobber.

THE CHICAGO HARDWARE DEALERS' PICNIC.

The cultivation of sociability among Hardware dealers is one of the leading principles of the Chicago Retail Hardware Association. Sociability is promoted in a variety of ways, never being completely lost sight of even in the most important business meetings. One of the leading features of the strictly social side of the organization is the annual picnic, as on that occasion the members can relax completely from the cares of business and can include their families in the entertainment provided. The seventh annual picnic of the association was held on the 17th inst., at Fox River Grove, some 40 miles northwest of Chicago. Two special trains, comprising 23 cars, were required to convey the members, their families and their friends to the grounds, which were on the line of the Chicago & Northwestern Railway. The arrangements were in charge of the following committees:

Executive Committee: Anthony Engelhardt, president; W. B. Costello, treasurer; Fred. Ruhling, secretary; W. T. Gormley, H. E. Gnadt.

Refreshment Committee: H. C. Peppler, J. F. Borchardt, L. E. Steinagle, F. H. Schanze.

Transportation Committee: J. L. Smith, G. R. Lott, Levy Rosenberg, Fred. Kurtz.

Entertainment Committee: F. F. Porter, O. Stebbins, W. J. Krueger, H. Stuckart, G. A. Engelhardt, Otto Hagen, C. E. Peterson, Emil Sanders.

Games Committee: D. McLaughlin, A. L. Adam, Martin Engelhardt, Sig. Melhon, Hans Fehr, John Schubert, G. Pfeiler, C. A. Dalstrom.

The members of these committees all worked vigorously and effectively to make the seventh annual picnic one of the most memorable days in the history of the association. They were favored by good weather and a large attendance, and the arrangements were so well made that everything passed off smoothly.

Among the amusements of the day was a programme of races and contests of various kinds, which excited a great deal of interest. Prizes were donated by the following Chicago wholesale houses and representatives of Hardware manufacturers, several concerns contributing two or more prizes: C. Sidney Shepard & Co., E. C. Atkins & Co., Hibbard, Spencer, Bartlett & Co., Ranney Refrigerator Company, Geo. M. Clark & Co., S. Lyons, Schneider & Trenkamp Company, Geo. W. Trout & Co., Landers, Frary & Clark, Jacob J. Vollrath Mfg. Company, Bullard & Gormley Company, New York Belting & Packing Company, Brand Stove Company, Forest City Auger Bit Company, Geo. H. Bishop & Co., Barler Mfg. Company, L. Gould & Co., Geuder, Paeschke Mfg. Company, J. L. Perkins & Co., Cole Mfg. Company, the *American Artisan*, Lawton Cutlery Company, and Wells & Nellegar Company.

Special prizes were also donated by the Reading Hardware Company and the Ohio Tool Company.

Among the contests was a baseball game between the jobbers' representatives, captained by Geo. W. Trout, and the retailers, which was won by the jobbers with a score of 10 runs to 9.

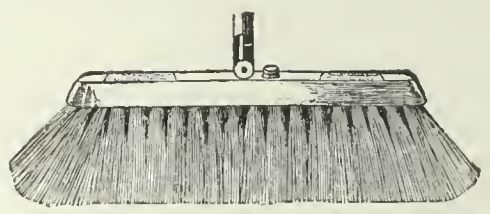
The Chicago wholesale and manufacturing interests were well represented. Hibbard, Spencer, Bartlett & Co. were represented by R. J. Blum, J. Guldeman, J. H. Tieke, W. F. Waller, J. S. McDougall and A. Fritchie. C. Sidney Shepard & Co. were represented by G. L. Lacmmar and J. F. Lethen. Wells & Nellegar Company were represented by Louis Pegelow and Judson Fuller. Geo. W. Trout & Co. were represented by Geo. W. Trout, W. F. Puls, Andrew Dickson, Otto Ollendorff and Adolph Hassman.

Among other salesmen present were the following: E. O. Geschwind of Landers, Frary & Clark; John J. Sinzich of Geo. H. Bishop & Co., W. C. Matthews of the Reading Hardware Company, Thomas Bowler of the Lawton Cutlery Company, Wm. G. Miller of the Ohio Tool Company, W. B. Lyman of the Brand Stove Company, S. M. Perrigo of C. M. Avery & Co., Harry J. Searles of the J. L. Morris Stove Repair Company, M. B. Widener of the Cook & Van Evera Company, F. H. Warren and P. J. Hennessy of the Michigan Stove Company, J. F. Cannon of the New York Belting & Packing Company, A. C. Ohlendorf of the United States Steel Lock Company, W. S. Cutler of the Ranney Refrigerator Company, J. H. Batchelder of Geo. M. Clark & Co., Chicago; F. W. Cunningham of Manufacturers' Stove Repair Company; C. J. Fagen, Domestic Plating Works; Chas. F. Johnson and Hugo Langner, with T. C. Cunningham; Fred. E. Rebmann, L. Gould & Co., Chicago; F. H. Suter, Edwin Hunt's Sons; Carl Vollrath, Jacob J. Vollrath Mfg. Company, Chicago.

W. H. Bennett, manager of the Chicago branch of the Reading Hardware Company, was one of the leading spirits in stirring up entertainment and enthusiasm. He presented everybody with a good luck pocket piece, consisting of a 1-cent coin with an aluminum rim bearing good luck emblems and appropriate lettering.

The World's Only Sanitary Dustless Floor Brush.

The accompanying illustration represents a dustless floor brush placed on the market by the Milwaukee Dustless Brush Company, 121 Sycamore street, Milwaukee, Wis. The brush is designed to lay the dust while sweeping instead of raising it, so as not to damage the stock in a store, the furniture in a room, or settle on the floor again. This result is accomplished by the use of kerosene oil to prevent the dust rising. The brush is made of good bristles, inserted in the center of which is one row of a special fiber which, it is shown, readily absorbs and holds kerosene oil. The oil supply is carried in a metal reservoir in the top of the brush, which is so arranged as to keep the fiber constantly moist when the brush is in use, the feed being regulated by opening or closing the cap through which the reservoir is filled. The wood surrounding the reservoir is chemically treated to prevent it absorbing any of the oil. The dust is collected by means of the oil in small pellets, which can easily be taken up by a dust pan in the usual manner. The brush, the manufacturers state, can be used on any kind of floor or carpet, as it improves and hardens floors and cleans and brightens carpets. The kerosene is referred to as destroying the disease breeding germs carried by dust, and as killing moths, fleas or other insects on the floor or carpet. The brushes are made in a number of sizes to suit various requirements.



The World's Only Sanitary Dustless Floor Brush.

BLACKWELL HARDWARE COMPANY have lately engaged in the retail Hardware, Stove, Tinware, Agricultural Implement and Vehicle business in Blackwell, O. T. The members of the firm are W. H. Michael and E. F. Mathis. The former was for many years with D. M. Osborne & Co., the last ten years as general agent and manager of their Denver, Col., house. From October 15 last to June 1 he acted as general agent at Wichita, Kan., for the Acme Harvester Company of Peoria, Ill. Mr. Mathis is from Monument, Col., where he was formerly engaged in ranching, &c.

The Iron Age Removable Leaf Price Book.

The David Williams Company, 232-238 Willlam street, New York, have just added to their comprehenslve line of hardware price books long on the market a price book with removable leaves, as here illustrated, which is especially suitable for store or office use. This book is arranged for conveniently

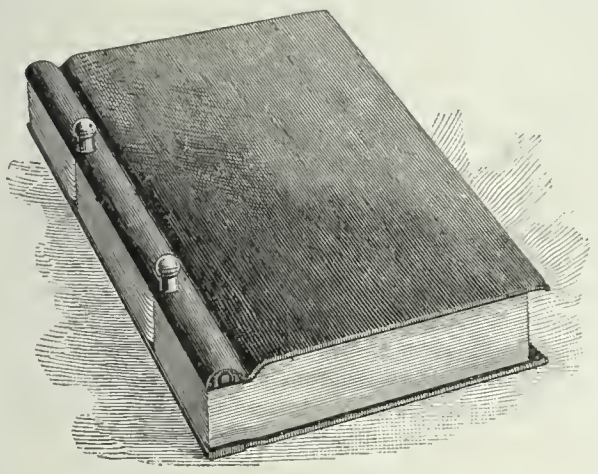


Fig. 1.—The Iron Age Removable Leaf Price Book.

and expeditlously recording prices and quotations, and will be known as The Iron Age Price Book I. The book ls 10 x 10 lnches square, has 250 leaves (500 pages), and its capacity can be increased indefinitely at the will of the owner. The covers are made of stout flexible leather of enduring quality, the upper cover having a rigid half round back, 1 inch wide and ½ inch thlck, through which two ⅜-inch nickeled brass posts, firmly secured to a somewhat similar back on the bottom cover, pass, secured at the top by milled thumb nuts. In Fig. 1 will be seen the square recessed head of a

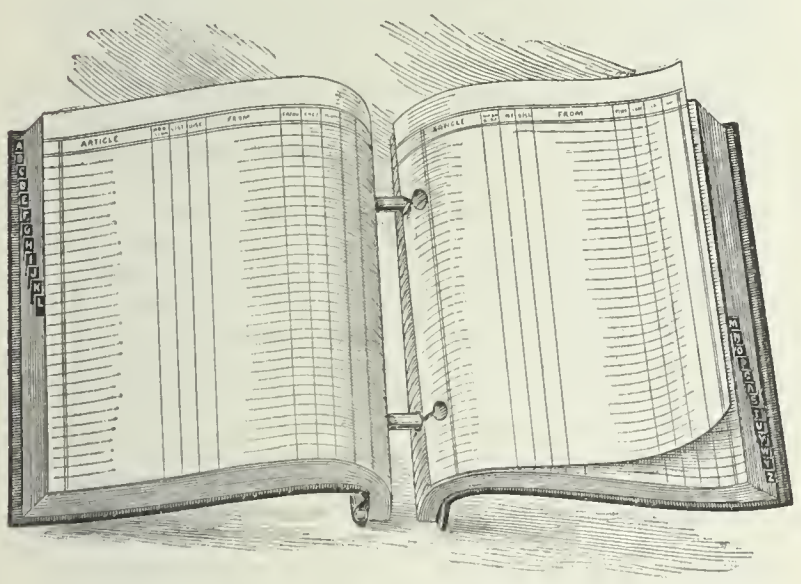

Fig. 2.—Showing Manner in Which Leaves Are Inserted or Removed.

lateral screw ln the oval back, which is operated by a long slender key, furnished with the book, for locking the cover on. By means of the extension posts, which are supplied in sections 1 inch and ½ inch long, the book can be made to hold any reasonable number of extra leaves, by removing the cover and inserting one or more as occasion requires.

The leaves are ruled on both sidos, and there are permanent leaves having projectlng leather alphabetic index tabs to properly divide the alphabet. The columns for entries are headed with the words: Article, No. or sizo, List, Discount, From, Freight, Cost, Retail, Job, with a blank column over 1 inch wido at the extreme back. The sheets are so prepared at the back that when the book ls open a flat surface is provided, which greatly facilitates the making of entries.

A striking feature of the book is the ease with which extra leaves can be slipped in at any point, making its capacity adjustable and elastic for any one's requirements, even if no two users' wants are the same. The book is sold for $12.50 each and extra leaves can be obtained for $1.50 per 100.

Monongahela Valley Retail Hardware Dealers' Association.

This association issues its constitution and by-laws in convenient pamphlet form for circulation among retail merchants and also jobbers and manufacturers with whom they have to do. It refers conspicuously to the way in which the trade of the retail Hardware dealer is encroached upon by the catalogue house and department store, and calls upon the trade to unite their efforts against these evils, making the point that organization is the keynote of success in modern commercialism. The following preamble and resolutions are given place in the pamphlet:

PREAMBLE.

The Monongahela Valley Retail Hardware Dealers' Association is intended to include in its membership all legitimate Hardware dealers throughout the Monongahela Valley and vicinity.

The trade recognize the desirability of an organization and the need of closer social and business relations, realizing that much unjust competition arises from misunderstandings and imaginations therefrom.

We also feel the need of some protection from the indiscriminate sale of goods by manufacturers and wholesale houses to those who are not in the regular trade and arc not entitled to recognition as Hardware dealers from manufacturers and jobbers.

RESOLUTIONS.

Whereas, Some manufacturers and jobbers in general Hardware, Stoves, Tinware, Paints, Leads, Oils, Varnishes and kindred lines pertaining to the Hardware business persist in selling their goods through illegitimate channels, placing us toward our customers in the light of extortioners and causing a general demoralization in the retail Hardware trade,

Resolved, That the members of this association confine their purchases of Hardwarc, Stoves, Tlnware, Paints, Leads, Oils, Varnishes and kindred lines as far as practicable to manufacturers and jobbers who sell goods to firms only that are legitimately engaged in the retail Hardwore business as defined in these resolutions.

Resolved, That any manufacturer or jobber in Hardware, Stoves, Tinware, Paints, Leads, Oils, Varnishes and kindred lines, furnishing net prices or discount sheets contrary to the foregoing resolutions either by themselves, employees or agents, shall be considered as disapproving of these resolutions.

Resolved, That it is injurious to the retail Hardware dealers of this association for manufacturers and jobbers to make estimates or quote net prices direct to the consumer for Hardware, Tinware, Paints, Leads, Oils, Varnishes entering into the construction of buildings or for private use, and that all such estimates or net prices shall be made through a legitimate Hardware dealer.

Resolved, That every member of this association constitutes a committee of one, and is expected to report to the proper officers any violations of these resolutions.

Resolved, That these measures are just and necessary for our welfare, and it is expected that the rigid enforcement of the resolutions will be carried out.

LETTER TO JOBBERS AND MANUFACTURERS.

With a view to inducing manufacturers and wholesale Hardware houses to sell only to legitimate Hardware dealers, the following letter has been prepared and is being sent out by members of the association:

An organization of the retail Hardware dealers of the Monongahela Valley has been formed under the name of the Monongahela Valley Retail Hardware Dealers' Association.

We inclose you a copy of the constitution and by-laws of this association, and respectfully ask that you carefully examine same. We believe that this examination will result in your giving the cause your hearty sympathy, and that you will co-operate with us in working together for our mutual good.

The aim of the association, which we believe is a legitimate one, is explained in the preamble to the constitution. The condition of the retail Hardware business at the present time is, to say the least, alarming, and the future outlook is anything but bright. What

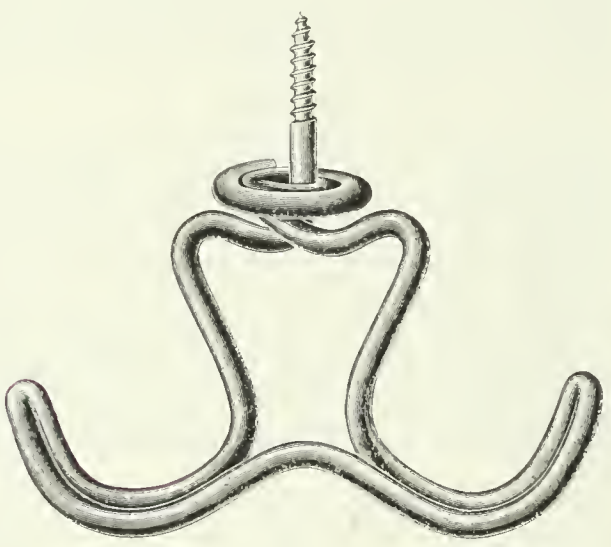
we ask, and we feel that we are not asking too much, is that manufacturers and wholesale Hardware houses sell to none but legitimate retail Hardware dealers.

Further, the members of the association have resolved to confine their purchases as far as practicable to manufacturers and jobbers who co-operate with us in this matter, and who sell to none but legitimate retail Hardware dealers.

We feel confident that a thorough investigation of existing conditions will prove that our position is justifiable, and that the Hardware manufacturers and jobbers will gladly give us their support. Our cause is spreading throughout the State, and in order to concentrate our efforts along this line, we hope in a short time to have the retail Hardware dealers of the State united in one association for the betterment of the trade, realizing that in union there is strength.

Jenckes Ceiling Hook.

E. Jenckes Mfg. Company, Pawtucket, R. I., for whom John H. Graham & Co., 113 Chambers street, New York, are direct representatives, have just put on the market the Jenckes ceiling hook, as here illustrated, which can also be used for many other purposes. The extreme dimensions of it are, width 3¼ inches and hight



Jenckes Ceiling Hook, Three-quarters Size.

2¾ inches. The main difference in coustruction from somewhat similar hooks is the twisted coil or rosette of wire at the base of the screw, which gives a good backing against whatever material it is screwed into. It is finished in copper, japan and bronze, packed one-quarter gross in a box and six gross in a case.

Stove and Hardware Dealers.

In a notice of the annual meeting of the "Vulcan Club" of Cleveland, Ohio, appearing in our issue of July 13 an unfortunate omission was made in presentiug the names of the newly elected officers. Instead of "E. F. Dettlebach" of the Dettlebach Plumbing & Heating Company having been elected secretary, as therein stated, E. F. Bohm, who has filled the office for the past two years, was re-elected thereto, W. H. Dettlebach being re-elected to the position of treasurer of the organization.

Some time ago announcement was made of the intention of Sidney Shepard & Co. of Buffalo, N. Y., to remove to a new plant which is to be built on the outskirts of that city. We are now informed that plans for the building are uow out. The principal factory is to be three stories high aud 138 x 80 feet. Other buildings will be 60 x 204 and 40 x 40. A boiler house and engine room will also be built. The concern are manufacturers of Tinware, Stamped and Japanned, and Aluminum Ware.

F. F. Wehsner has disposed of his Hardware, Stove and Farm Implement business in Wautoma, Wis., to John Sleath and Halbert Hanson, who will continue at the old stand under the style of Hanson & Sleath.

Callaghan & Richardson Company, Reed City, Mich., are about to put in a full line of Hardware and will appreciate copies of catalogues and price-lists relating to the general line, as well as Steel Ceilings, Roofing, &c.

M. Seller & Co., who are dealers in Stoves, Crockery, Glassware, Cutlery, Lamps, Tinware, Wooden Ware, &c., with stores at Portland, Ore., aud Seattle and Spokane, Wash., are about to add a line of Hardware to their stock at Portland, and will value catalogues, price-lists, &c. They will conduct a strictly jobbing business and expect to handle a general line of Hardware.

A. Cording & Son have succeeded Miller & Jones, Hardware and Stove merchants, Gibson City, Ill.

Hall & Torrey have succeeded Hedge & Hall in the wholesale and retail Hardware, Stove and Agricultural Implement business in Rockland, Mass.

Mobile Hardware Company, Mobile, Ala., have been incorporated with a capital stock of $10,000. The interested parties are G. P. Martin, G. A. Tonsmeire and J. A. Lewis. They will conduct a wholesale and retail business in Shelf and Heavy Hardware, Stoves and Tinware and Agricultural Implements.

In pursuance of an order of the Superior Court, Henry G. Newton, New Haven, Conu., receiver of the Merriam Mfg. Company of Durham, Conn., makers of Tinware, who have beeu in the receiver's hands for seven years, sold the plant of the company at auction last week. The plant was bought in by Mr. Newton, representing the Durham creditors. It is understood that the factory is to be reopened at once and run under the old name, the courts having given permission to retain the name.

The Manitowoc Aluminum Company of Manitowoc, Wis., have opened a New York office and salesroom at 15 Whitehall street. The office is in charge of Charles B. Corwin, who will pay particular attention to the export trade.

James McGolpin, manufacturer of Tinware, Toronto, Canada, announces that he has removed his manufacturing plant to larger and more commodious premises at 156 to 162 Duke street, Toronto. Having added improved machinery and thereby increased his facilities, Mr. McGolpin is now in position to supply Tin Cans and Lard Pails in addition to the lines of Tinware formerly carried.

The National Enameling & Stamping Company are offering to the trade a high grade line of White and White Enameled Steel Ware equal in every respect to the imported product, and also a line of Brown Brilliant Enameled Steel Ware. These goods are made by the compauy's factory at Bellaire, Ohio, which has always been celebrated for the high grade White Lined Enameled Ware produced there. Nothing but these two lines will be manufactured at this factory, and in this way it is expected that orders will be filled complete. To those who are not familiar with the Brown Brilliant Enameled Steel Ware the factory will be pleased to send samples, and all inquiries will receive prompt attention.

A letter from D. M. Steward, Chattanooga, Tenn., contains the announcement that he has purchased the entire plant of the D. M. Steward Mfg. Company. The business will be continued by him under the same name and without any change in management, as Mr. Steward has been for a quarter of a century president and manager of the old company. He solicits a continuance and extension of patronage. A large plant is operated in Chattanooga, making Lava Electric Insulators, Gas Tips, Slate Pencils, Dustless School Crayons and Crayons for rolling mill and metal work, as well as Tailors' Chalk and Soap Stone Pencils; Talc Powder and Foundry Facings are other products of the plaut.

The Star Electric Gas Lighter Company of New York City have been incorporated with a capital of $25,000. The directors are Jacob Harzfeld, Julius Wielar and Siegfried Scherk, New York City.

Patrick H. Kelly, president of the Kelly Boiler & Sheet Iron Works, New Orleans, La., died at his home in that city on July 8 at the age of 47 years. Mr. Kelly organized the company that bears his name in 1897.

International Heaters at Chicago.

The International Heater Company, Chicago, have placed in their sample room at 48 Dearborn street specimens of several new productions just brought out in the company's foundries. Among these is a new horizontal section boiler designed for both steam and hot water, which is named the Carton F series. Two sizes are shown. This boiler has a round fire box, the special feature of which is the large amount of direct overhanging surface. Circulars and quotations referring to this boiler will shortly be ready for distribution to the trade.

Another new product shown is the Palace Regent warm air furnace for hard coal and wood. This furnace is one which has already acquired a fine reputation, but has been remodeled and in its new form is expected to attain still greater popularity. It has been fitted with a very large double feed door, which will enable large chunks of wood to be used. This furnace has a steel radiator with triple radiating faces, furnishing a large area of effective heating surface so arranged as to provide for the warming of an immense volume of air. The radiator has a very long revertible fire travel. An automatic gas damper in the radiator opens automatically whenever the pressure of gas in the combustion chamber becomes unusually heavy, thus obviating all danger of explosion and the discharge of gas into the cellar. The fire pot is constructed in two pieces and is both deep and straight. The company report both their boiler and furnace business very active.

Annual Outing of Wilkes-Barre Master Plumbers.

On Saturday, July 20, the Master Plumbers' Association of Wilkes-Barre, Pa., enjoyed their annual outing at the picnic grounds on Stop Cock Island, in the Wyoming Valley. The day was perfection in the way of weather, with cloudless skies and thermometer ranging below 80. In the attractive surroundings of the picnic grounds the members of the association and their invited guests enjoyed a delightful day. Among the attractions offered was a series of sports, which were greatly enjoyed, the sack race and fat men's race proving particularly interesting, while the 50-yard dash between Hazleton and McKnight, the two largest men present, was closely contested, the latter winning by a nose. Hazleton claimed that the vichy he drank before the race was carbonated with less force than that imbibed by McKnight, in this way explaining his defeat. The commissary department was in charge of John Connor, chairman; G. T. Farrell and Charles Liem. Charles Travers officiated as *chef*, and his broiled chicken and steamed clams were found highly palatable.

The party was honored by the presence of George Shiffer, outside superintendent, and Arthur Casweli, inside superintendent of the D & H mines, who thoroughly enjoyed the games. From Kingston came the veteran plumber, H. F. Johnson, Sr., who has attended former annual outings, also Willis H. Miller. The following members from Wilkes-Barre were present: Charles Erath, Richard Turner, Peter Forve and Dan Shevlin, J. H. Campbell, Joseph Schuler, Barney O'Rourke, William Casier, Charles Liem, John Connor, Frank Fluegel, James Gorman, Alfred Speicher, Martin Hochreiter, Frank Babb, Herman Wagner, Henry Spangleberger, J. S. Monks, and last, but not least, Plumbing Inspector Griggs.

Garry Farrell of Plains, one of the busiest members, who was the first to arrive and the last to leave, because he lived close by, umpired a closely contested game of baseball, captained by the two stout men, Hazleton and McKnight. The game was won by Hazleton's side by the close score of 17 to 16. Among the travelling men who assisted in the day of enjoyment were the following: Thomas F. Hazleton, representing Owen and Salter of Philadelphia; John W. McKnight, representing Ford & Kendig of Philadelphia; Thomas Berkstresser, representing Fieck Brothers, Philadelphia; James Evans, representing the Pittston Stove Company; V. H. Arnold, the Pittsburgh tin plate man, representing Follansbee Brothers Company, New York; Luke Horan, with Foote & Shear of Scranton, and Charles Morrison, connected with the Richmond Stove Company of Norwich, Conn.

Quality of Range Boilers.

It is not uncommon in business as well as in domestic life to hear remarks about the excellent quality of things in the old fashioned times. Those who frequently have had occasion to renew range boilers in their properties since steel has been largely used in the construction of these useful articles are very prone to lament the lack of quality in their later purchases. With a view of furnishing boilers equal to the best that ever could be purchased, L. O. Koven & Brother of 50 Spruce street, New York, have a large factory building in Hoboken, N. J., equipped with machinery especially designed for the work. With the machinery and workmanship under their control, the firm, by careful inspection and testing, can be sure that everything that passes out of their hands is strictly first-class. The concern have also continued the use of iron in their goods. When steel quite generally supplanted iron the house experienced some difficulty in getting iron of the quality they desired. In order to secure material which met their approval it has been their custom for a number of years to place early in the season large orders with the rolling mills, and to have the iron rolled to their specifications, both as to dimensions and as to quality. This fact is well known to many in the trade, as is also the care with which the firm have labored to keep up the quality of their productions, and this has contributed in no small degree to the popularity and the success of the Koven boi er.

New York City Notes.

Trade is very brisk at present in all branches of the business in Manhattan and material is not coming fast enough to suit many. The two journeymen's organizations have fewer men out just now than for a long time past. Bronx Borough is not so busy, as but few new apartments are being put up there, owing to the new tenement house law.

* * *

Among the busy plumbers are Harry Spencer, with an apartment on 101st street, East of Broadway; J. G. Collins has four tenements on 101st, east of Second avenue; W. H. Speiman & Co. have a private residence at 56 to 60 East Eighty-eighth street; John Tucker has a residence on corner of Fifth avenue and Eighty-fourth street; Geo. F. McQuillen has a large apartment house on West Forty-third street; J. W. Unnever has seven tenements on 101st street, between First and Second avenues; Calian & Oliver have five flats on 139th street, east of Lenox avenue, and one flat on 141st street, west of Lenox avenue; and Reynolds & McMahon have a large apartment house at the corner of Park avenue and Ninetieth street.

* * *

M. F. Donohue is busy with overhauling and is plumbing the extension of Weber & Fields' Music Hall on Broadway.

* * *

Bids are now in for plumbing the new Hall of Records and it is said that the job will go to a prominent Columbus avenue plumber, he being the lowest bidder. This is the last of the municipal jobs on hand where the plumbing is in the general contract.

* * *

James Harley of Brooklyn Branch was the successful bidder for plumbing the new High School being erected on 114th and 115th streets, west of Seventh avenue, he having beaten the other competitors by a small margin.

* * *

The new Bronx Branch is growing rapidly and is getting in many members, who would not join the parent organization owing to the different conditions existing between the two parts of the city.

Hot Air Furnace Heating.*

BY C. G. FOLSOM.

The subject which I have chosen is "Hot Air Furnace Heating." The house which is the basis is in South Bend, Ind., and is exposed on all sides—no protection whatever—a frame structure thoroughly built on a stone foundation (what we term, locally, field stone) with cement mortar, and is a two-story residence with an attic. The first story is stone veneered 6 inches thick, as may be seen in the picture, Fig. 1. The buildings of this description in our town are almost all

Hot Air Furnace Heating.— Fig. 1.—General View of House.

isolated and are not constructed on the same plan and with the same idea that city buildings are constructed, where the ground that they are built on is worth considerably more than it is in our city.

The house, the plans of which are given in Figs. 2, 3 and 4, is well arranged as a residence and very convenient. It is the work of Freyermuth & Mourer, architects, of our city. The structure, as it now stands, cost about $6000. I contracted for the heating of this building at a disadvantage, for the frame was up and inclosed, chimney was built, and it was left me to arrange as best I could. The owner wanted the work the best that could be had under the circumstances and was willing to pay for it.

The furnace used was a tubular construction with 26-inch fire pot and an open labor saving grate. It will be noted that there are 14 pipes from this furnace, which occupy nearly all of the available space on the top of the furnace. It will also be noted that the pipes are fully as large or larger than those very often used under more favorable conditions. The stacks are larger than are usually placed in a building in our part of the country, being 4 x 12 inches, which is the space that is between the studding. There is 30,000 cubic feet to heat. The manufacturers' estimate is 30,000 to 50,000 cubic feet for the heater used. There is an inside lining of tin all around inside of what is termed the casing, which is of galvanized sheets, and asbestos sheets are pasted on between these casings.

The piping is of bright charcoal tin, IX, and the joints are double seamed. The wall stacks are of bright tin and are double, except two of them, which are covered with three thicknesses of asbestos paper pasted on. At the base of each stack there is a boot of extra size, also of bright tin. The longest round pipe from furnace is 26 feet 8 inches and is 9 inches in diameter. This connects with the stack to the bathroom on the second floor. This stack has an outlet or register 5 feet from the floor, as there was no place in the floor for the register. The shortest pipe is about 8 feet long and 10 inches in diameter. The round hot air pipes rise about 1 inch for every 10-foot length of pipe.

*Paper read at fourth semiannual meeting of American Society of Heating and Ventilating Engineers, Chicago, July 13, 1901.

The furnace is over a pit 24 inches deep, and the air duct is formed by a 4-inch brick wall on two sides of a trench that is 24 inches deep and wide enough to have a capacity of 720 inches.

The area of a 12-inch pipe is 113 inches and in three of them there are 339 square inches.

The area of a 10-inch pipe is 78 inches and in three of them there are 234 square inches.

The area of a 9-inch pipe is 63 inches and in eight of them there are 504 square inches, making the total area of the combined hot air outlets 1077 square inches.

There is nearly two-thirds as much cold air inlet as the combined area of the 14 pipes that carry the hot air from the furnace to the several rooms in the house.

In the dining room there is a register face, 28 x 28 inches in size, that takes the return air from the hall, two parlors and the dining room. The outside air that is used is taken through a window in the basement up near the joist and is conducted down to a duct underground. The return air duct is attached to this outside air duct from the window, so that by turning a damper, which has a handle on the outside of the duct, the air can be used either from outside of the house or an inside circulation can be used.

Now there are also return air ducts, made of bright tin, from every room in the house. They connect with this inside duct for the circulation of the partly

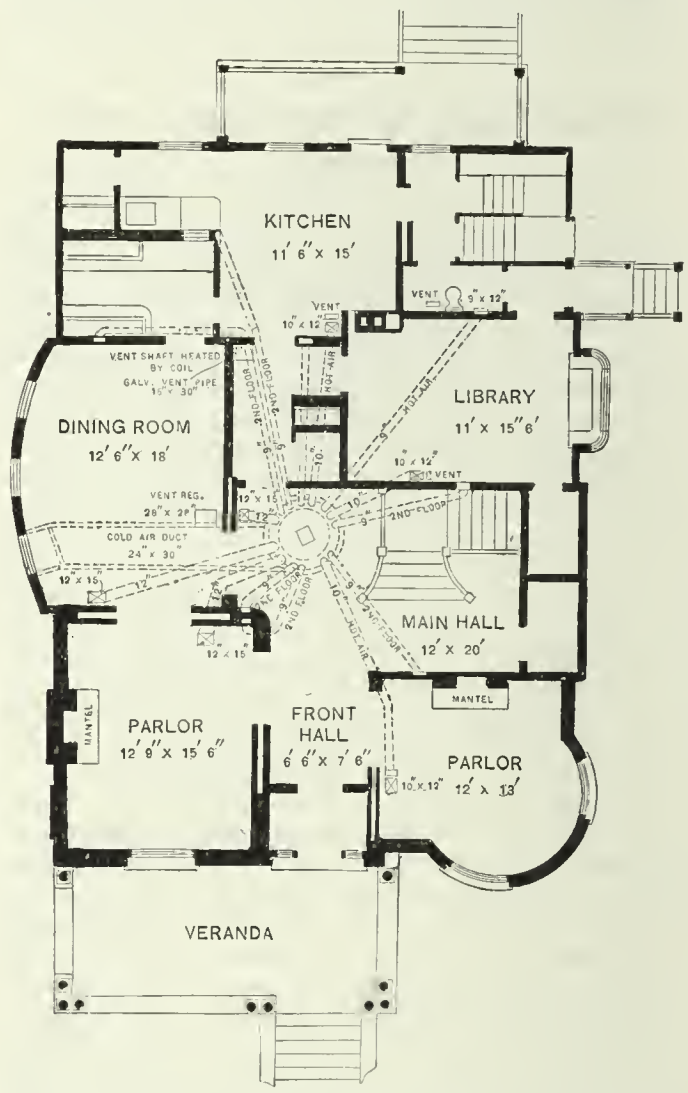


Fig. 2.—Plan of First Floor, Showing Arrangement of Hot Air Pipes in Basement.

heated air. These bright tin pipes are three-fourths the capacity of the hot air pipes from the furnace to the different rooms.

By the side of the feed door in the furnace there are two 1-inch holes for pipe connections with a water heater. These water heating pipes extend into the furnace over the fire and are for the purpose of heating a coil in a galvanized iron stack that extends from the basement up into the attic, where it is carried over into a large chimney flue. This stack is for the purpose of ventilating the two closets (one on the second floor and one on the first floor). A tank in the attic, which is filled with rain water, is connected to supply the hot water

coil in the galvanized iron stack, which is used to exhaust foul air from these closets.

Five examinations of the temperature of the rooms of the house were made in January, February and

Fig. 3.—Plan of Second Floor.

March. The average was 69 degrees. All but one was made in the morning and that one was at 4 p.m. The fuel used was hard coal, and not 10 tons were used for all the fire from October 29, 1900, to May 1,

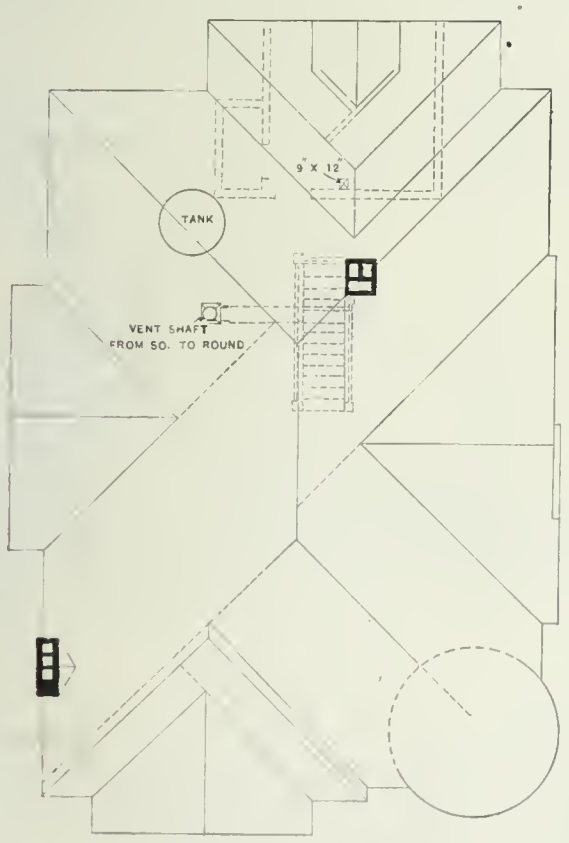

Fig. 4.—Plan of Attic.

1901. The family were satisfied with the temperature of the house. I was there when the thermometer registered 8 degrees below zero. This was the only time that I saw the fire at a white heat.

I have no way of testing the velocity of air at the register except with an anemometer, and I could not get much satisfaction from that instrument.

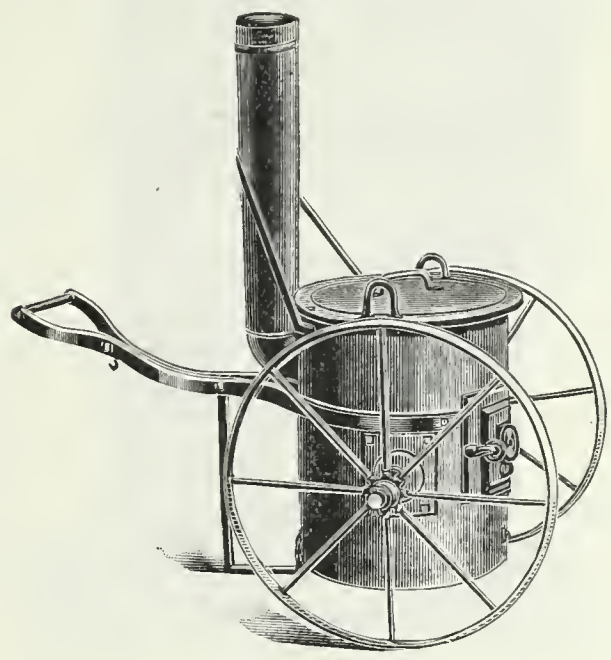
I wish to state that in drawing the air out of the galvanized stack I was surprised to find that these two small rooms were so easily heated. In the coldest weather they were the warmest. At least they were always warm.

In this house there is a small family—man and wife and two children—and the leakage into the house of fresh air was considerable. The glass surface is enormous. All of the windows are large—at least one-eighth of the entire side walls.

In ordinary practice we do not take glass surface into consideration, for we try to install a furnace large enough to overcome all that is required.

Lead Melting Furnace.

In the accompanying illustration we show the lead melting furnace manufactured by D. R. Sperry & Co., Batavia, Ill. It is adapted for use of plumbers in laying heavy cast iron drain pipe and in laying large gas and water street mains. As can be readily seen by the cut, the furnace is mounted on wheels so as to be readily



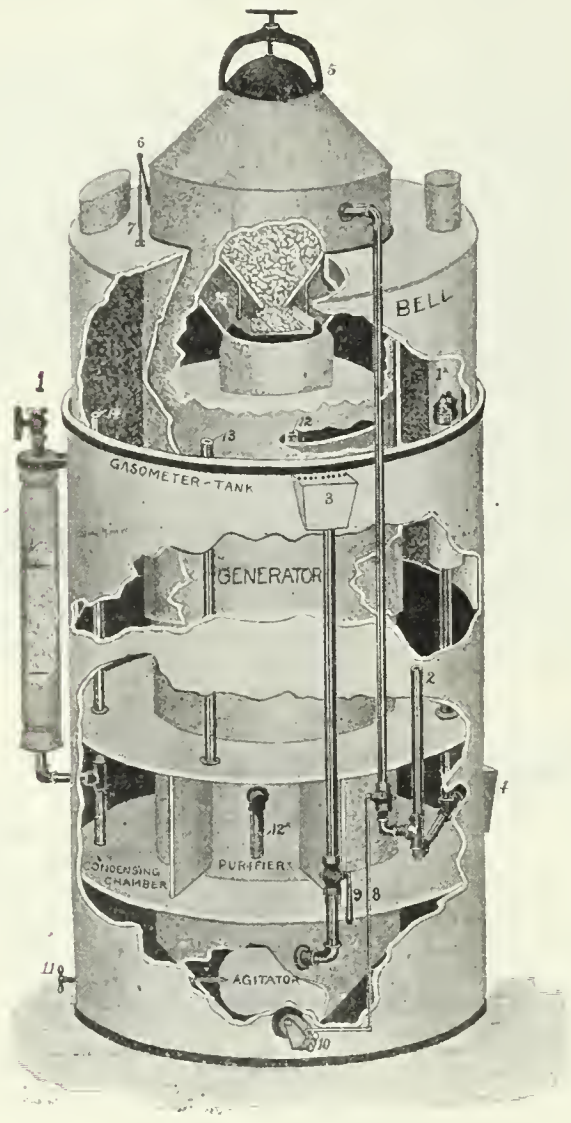
Lead Melting Furnace.

moved to the point where it is needed. It is constructed of 3-16-inch boiler steel and has a heavy cast iron fire pot inside the shell to protect it from the heat. It is provided with a grate which is arranged to dump and shake, and air is admitted to the fire through a strong fire door with a suitable draft opening. The kettle within the furnace is made very heavy and has a high inside flange to prevent the molten lead slopping over when the furnace is being moved. The kettle is also protected by a heavy steel cover. The handle provided for moving the furnace is equipped with a folding rest that locks in position, so that the furnace stands firmly on three points. The firm also manufacture the furnace without wheels, when heavy carrying loops are attached to the shell, so that it can be carried from place to place by means of two pieces of heavy pipe or iron bars.

THE organization of an association of master plumbers at Reading, Pa., was made the occasion for a very pleasant outing. Owing to the interest taken in the organization by the Master Plumbers' Association of Philadelphia that association was invited to join the Reading plumbers in an outing, which took place on last Saturday. A special train carrying 150 Philadelphia plumbers was run to Reading for the purpose. After enjoying a trolley ride through the beautiful scenery and mountains around Reading, a generous repast was served at Wildwood Park. The affair was voted by all who enjoyed it to be worthy of annual repetition.

The Drake Special Acetylene Generator.

A very popular form of acetylene gas generator is that in which the carbide is stored in a hopper and automatically thrown into the generating chamber as required. A new generator of this type is being put on the market by the International Heater Company of Utica, N. Y., which they call the Drake Special automatic acetylene gas generator. A broken view of this generator is presented herewith, from which its general operation can be readily seen. Compactness of construction is a feature, the machine being self contained, the generator, gasometer, purifier and condensing chamber being all in one tank. Owing to the large quantity of water in the generator and the small quantity of carbide which is automatically fed to it at one time the generation of absolutely cool gas is a feature. In feeding carbide it is placed in the hopper, which discharges on a flat plate or pan attached to a shaft and located just below the bottom of the hopper. When the gasometer falls, as a result of the gas which has been generated being consumed, it automatically operates the shaft, which tilts the pan or plate, and the carbide is spilled into the water. This provides a positive yet automatic feed, simple in arrangement, that is not disposed to clog or overfeed.



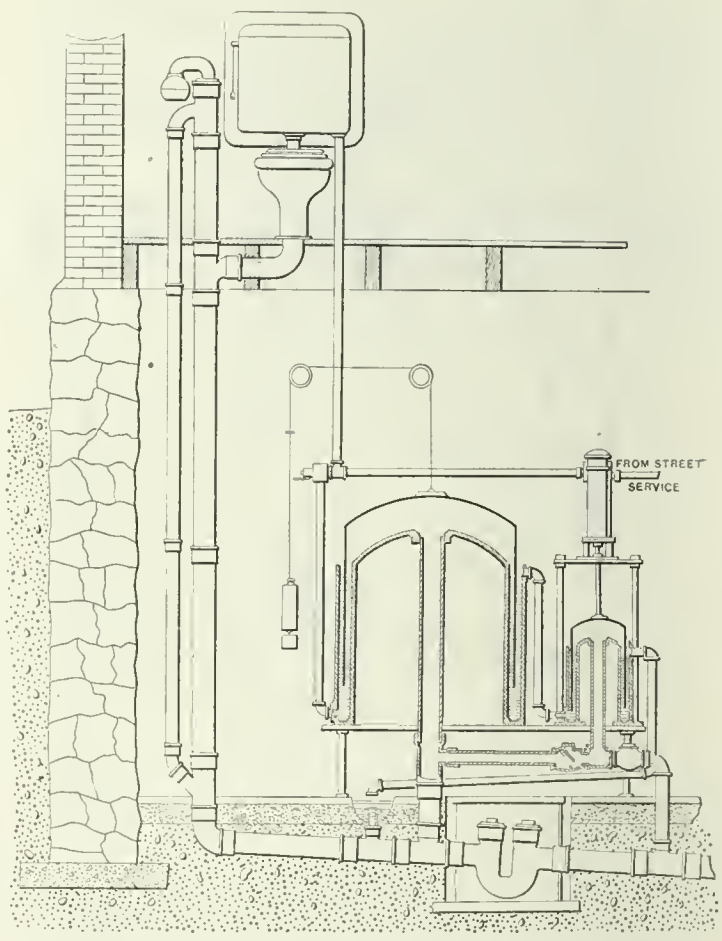
The Drake Special Acetylene Generator.

The simplicity of arrangement and construction of the generator is such that it can be readily set up without risk of making a mistake in connecting, or of a leaky pipe causing annoyance. Another advantage is that the generator can be taken entirely apart without unfastening a single bolt or screw. The condensing chamber permits every pipe in the apparatus to have an open end and to be drained directly into it, so that the chance of clogging is reduced to a minimum. Its compactness is a convenience for transportation, while making it light in handling. In operation, after the carbide has been discharged into the water in the generator the gas generated raises the gas bell, is forced to pass down through pipe 12 and enters the purifier at the point 12*x*, where, after cleansing, it rises through pipe 13 into the gasometer. From here it passes through pipe 14 into the drier and is carried to the house pipes through the service cock No. 1. Undue pressure or excess of gas is disposed of through the bell rising until the pipe 1*x* is lifted out of the water, allowing the gas to pass off freely through the open air pipe.

In the bottom of the generator there is an agitator, which by turning the handle 11 separates the refuse from the carbide and allows the refuse to be drawn off through the valve 10. It is unnecessary to take the machine apart or clean any receptacle if a pipe runs to a sewer connection. The generator is made of 20 gauge galvanized iron and all seams are either riveted or double seamed and soldered. All fittings are of malleable iron, and all connections are packed with red lead and asphaltum. To set the machine up for operation it is only necessary to connect the drier and make two pipe connections, one with the main service pipe and the other with the open air pipe for a safety outlet. The generator is made in 16 different sizes, adapted for supplying from 10 to 800 burners of ½ foot capacity, so that an apparatus suited to the number of burners to be supplied can be selected. The company have recently issued a new catalogue devoted to the Drake Special generator, which gives full detailed information.

A VACUUM PLUMBING SYSTEM.

The method of ventilating plumbing systems in general use has met with some positive objections. The fresh air inlet is often a foul air outlet, and the roof end of the vent pipes are required in the plumbing regulations of some cities to be placed at some distance from any window. Smith & Sayers of 487 and 489 Broadway, Newburg, N. Y., are manufacturing and putting on the market a patented vacuum plumbing system of their own design to obviate the necessity of both the fresh air inlet and outlet. A feature of the system, which is illustrated herewith, is an air chamber, which may be placed in the basement of a building. In connection with it is a small motor pump designed to keep the air chamber full under all conditions. It is pointed out that by its use there is no occasion for the vent pipe to extend above



A Vacuum Plumbing System.

the roof of the building, which makes a substantial saving in the cost of the plumbing work. The fixtures, whether one or many, are ventilated in the usual manner and connected with the vent stack, which terminates immediately above the water line of the highest fixture. In the operation of the fixtures the air forced ahead of the water flush can rush up through the vent pipe to the soil stack to supply the vacuum that otherwise would be created as the water passes down the soil stack, and any air that might be compressed in the horizontal drain finds its way into the "variator," as the air chamber is called. The fresh air inlet may also be connected with this variator, so that as the fixtures are flushed the air, which always passes through the drainage system, may rush into the variator when it rises to make room. After the rush of water has passed the variator connection any suction or tendency toward vacuum is destroyed by the air passing down from the variator to restore the equilibrium.

When water is drawn at any fixture, the air pump is set in operation to cause air to pass from the variator and leave it in a condition to receive any excess air that might be forced into it by flushing the fixtures. After exhausting the air from the variator, the pump continues to operate so long as water is drawn for any purpose, and air to supply the vacuum thus created enters the piping system through especially constructed valves, which are placed at the top of every waste stack, where the vent pipe connects with it. If no water should be drawn for a long time and there should be a leakage in the system to cause the variator to rise, it will, by a fall of the weight connected with it, trip the valve and put the air pump into operation. By this means fresh air is frequently drawn into the plumbing system.

It is pointed out that with this system in operation any leak in the drain pipes instead of discharging the air into the building would cause the variator to rise and fall more frequently and exhaust the air from the building through the leaks. It is also pointed out that with this system surface water from cellar washing and ice box drip may be discharged into a trap located anywhere on the house sewer, and if at any time the seal is broken the variator will rise until it comes in contact with the valve which sets the motor in operation, when the discharged water from the motor will be carried to the pipes to reseal the trap. It is claimed that this arrangement procures absolute protection against the gases of the house drain; it effects mechanical ventilation of the drainage system, avoids the fresh air inlet ventilator and the vent pipes discharging above the roof, and effects a continual test of the plumbing system without any extra cost. The firm issue a pamphlet devoted to their apparatus and their system of plumbing, which can be secured on application.

BROOKLYN PLUMBERS' OUTING.

The manner in which the day is spent by the Master Plumbers' Association of Brooklyn, N. Y., at their annual outing has much to do with the popularity of the event. The Committee of Arrangements, composed of E. Macdonald, M. F. Gleason, William Brown, G. W. Smyth, Eugene Kelly and William Eirman, arranged this year for one of the large summer outing barges to transport the party to Donnelly's Grove at College Point, L. I. Embarkation was made from the Bridge Dock in Brooklyn on Wednesday at 9 o'clock sharp, Brooklyn time, which turned out to be 11 a.m., Eastern time. This is a customary delay and is pleasantly utilized in greeting the plumbers, their wives, daughters and sweethearts, as they assemble, and it is by no means the least pleasant feature of the day's outing. The journey up the river, passing between the two cities, by the numerous islands and through Hell Gate, has much to attract attention. A remarkable feature is the passing under the Brooklyn Bridge and the new East River Bridge, which latter structure on the day of the outing was pronounced by the engineer safe for foot passengers. Two ladies passed over the foot path for the first time.

Arriving at the grove, after breakfast was disposed of, all were eager for seats in the grand stand to witness the baseball match between the plumbers and the drummers. This year the plumbers were successful in taking their opponents into camp. Swimming races, foot races, sack races and other outdoor games were thoroughly enjoyed by the contestants and spectators, while good music was provided and many enjoyed the dancing in the pavilion. It is worth noting that in one of the shooting contests it was necessary for one of the contestants to make a bull's-eye in order to win. The spirit of mischief tempted him to shoot at a target with a larger bull's-eye, but his mirth interfered with his skill and apparently the target that he was shooting at was missed entirely. When the drum was beaten to announce that dinner was about to be served there was no difficulty in getting the party to fall in line for the fine repast served by Mine Host Donnelly.

Among the guests were members of the different city departments in Brooklyn, and Isaac J. Brown, A. H. Brown, T. A. Hill, B. F. Donohoe and Philip Brady of the Manhattan Branch of the Master Plumbers' Association of New York City. The supply houses of Brooklyn and New York were also well represented. The trip home by moonlight was made interesting by the distribution of the prizes to the winners of the different contests. When the party reached the dock all joined in thanking the Committee of Arrangements for the thoroughly enjoyable day spent.

Heating and Plumbing Notes.

Seestedt Brothers of Romulus, Mich., have purchased the buildings of the Columbian Wire Works in that town and will fit them up for the manufacture of Bathtubs. These buildings will be connected with their old factory by means of a viaduct across Howard street. The present factory will be used for the manufacture of Bathtub Rims, Water Closet Seats and Plumbers' Wood Work. These improvements in their facilities will increase the capacity of the firm's plant and enable them to turn out 100 finished Bathtubs per day.

Locke Brothers of Williamstown, Mass., are erecting a new building in connection with their plumbing establishment in order to secure increased warehouse facilities.

The plumbing establishment of E. D. Hornbrook & Co., 1212 Main street, Kansas City, Mo., was visited by fire on July 16, doing damage to the extent of $800.

Gorman & Millett, Wilkes-Barre, Pa., report that they are busier now than at any time for five years past. Among contracts recently finished by them is one for the plumbing, drainage and putting in an extensive water supply system at the Ganoga, Pa., Lake Hotel, also remodeling the Glen Summit, Pa., Hotel. They have just done the plumbing at three large cottages at the summer resort at Harvey's Lake, Pa.

The Monash-Younker Company of Chicago, Ill., with branch at 51 Centre street, New York, are sending to the steam fitting trade a hanger advertising their specialties. One side shows a picture of the company's main office and factory at 201 and 207 South Canal street, Chicago, and also the extensive and varied line of Steam Air Valves made by the house. The head of the line is given to their Perfected Duplex. Valves adapted for drip lines and for the air lines of vacuum systems are also displayed. Two styles of Hot Water Radiator Air Valves are shown, and sectional views are presented of two styles of Steam Traps made by the company. Radiator Shields and Steam Pressure Regulators complete the line of illustrations. On the back of the hanger is a complete price-list of the goods illustrated, giving the capacity of the Steam Traps and information in reference to the Pressure Regulators made by the concern, as well as instructions for use of their Radiator Shields.

The plumbers at Cambridge, Ohio, in future will receive $3 for a nine-hour day and the gas fitters $2.25.

The Vanderman Heating & Plumbing Company, Willimantic, Conn., are sending to the trade a four-page circular devoted to Vanderman's Adjustable Soil Pipe

Fitting. This Fitting is designed for use where for any cause a section of the Cast Iron Soil Pipe must be removed, either from damage or to allow a new fixture to be connected. The bell end is made with a coarse thread to receive a thread on the spigot end. This enables the adjustable fitting to be screwed closely together for insertion and connecting the main Soil Pipe and the Soil Pipe Fitting used for the new fixture, after which the joint is calked in the usual manner. These Fittings are proving very popular with the plumbing trade, as a better job can be made and in much less time with much less labor than by the old method of cutting off a section of Pipe and breaking two or three joints so as to have the stack loose enough to allow it to be sprung into line after several rigid parts are fitted. The circular gives the sizes and prices of the Fittings and also some special rates when purchased in sufficient quantities.

THE authorities of Attleboro, Mass., are enforcing the plumbing regulations in order to prevent invasion by Rhode Island master plumbers to do work in the city, without having passed an examination or taking out a license. It is claimed that the invaders interfere with local trade by adopting the rule of "half doing for half price." Much of the work done is said to be in violation of the regulations and inimical to the public health.

BARNDT & GEIGER of Buffalo, N. Y., have secured the contract for plumbing the Lafayette High School in that city at their bid of $13,000.

CUYLER & MOHLER, Baltimore, Md., manufacturers of Plumbers' Supplies, have completed plans for the erection of a four-story warehouse at the corner of William strect and Armistead lane.

JOB THORP, Westerly, R. I., has a contract for plumbing the residence of James Howard, and also for heating it with a Hot Air Furnace. He has a contract for the Copper work on a new stable for C. Goddard and will also do the plumbing and install a Hot Water Heating System in the residence of Peleg Barber. He has used Kelsey Furnaces in the residences of Arthur Perry and George Everett.

THE plumbing business in Wilmington, Del., is enjoying a boom through the action of the Board of Health requiring property owners to connect the drains on their premises with the city sewers.

THE WALSH BOILER & IRON WORKS, Springfield, Mass., have the contract for Stand Pipes which they are erecting in Buffalo and Copenhagen, N. Y.

TRAFTON & MUIRHEAD, Pawtucket, R. I., have the contract for plumbing the Woodlawn Baptist Church. The F. L. Smith Plumbing & Heating Company have the contract for the steam heating and will use two Boynton Boilers.

THE KELLY & JONES COMPANY of Pittsburgh have bought another piece of ground adjacent to the Singer, Nimick & Co. building on Water street. The two present buildings will be torn down and a large building erected, to be used as offices and warehouse by this concern.

THE contract for heating the Holly Institute at Salem, Va., and supplying the institution with water was awarded to the Salem Heating Company. The work is being done under the superintendence of R. H. Carper. Mr. Carper is also superintending the installation of a Heating Plant and plumbing at the Roman Catholic school at Wytheville.

JAMES MACKAY of the Kellogg-Mackay-Cameron Company, Chicago, arrived home on the 22d inst. after an absence of nearly three months, during which time he traveled over the entire Pacific and Rocky Mountain country. He found the heating business in very good condition everywhere, except possibly in Southern California. The heating contractors of Montana are extremely busy, and some large buildings are now going up in the city of Butte, which will require a great deal of heating apparatus. The State authorities of Idaho and Washington are erecting a number of public institutions, which will also need a great quantity of heating appliances.

THE AMERICAN RADIATOR COMPANY, Chicago, are enjoying a large volume of business. Their customers are placing orders very freely. Building jobs are now getting to a point where heating apparatus must be considered. Consequently this causes plans which have been talked about to develop into accomplished facts. They look forward to a heavy fall trade. A new boiler catalogue which is to be a very fine publication is in course of preparation and will shortly be issued.

THE STANDARD MFG. COMPANY, Pittsburgh, Pa., recently secured an order from England to furnish the British Westinghouse Electric Company with over 2000 Enameled Lavatories. This order was secured in competition with several other American manufacturers and also with the English and Continental plants. The Pittsburg concern secured the order owing to the fact that they have better facilities than any other competitor in the world. Their designs are more modern and their goods are the best that can be secured. It is understood that this order will be shipped in its entirety before the first of the year. This is a feat that could not be accomplished by any other concern in the business.

A LETTER from the Utica Heater Company, Utica, N. Y., informs us that the Chicago Heater & Supply Company of 54 Dearborn street are Western agents or managers of the Utica line of Furnaces and Boilers made by the Utica Heater Company, and that orders placed with them for goods required west of the Indiana State line will be promptly filled. The Western agency will carry stock for filling all small orders, while orders for larger quantities of goods will be shipped direct from Utica, where sufficient time is given to make the shipment.

THE clerk of the Newport School District at Towner, N. D., will receive bids until August 1 for a Heating Plant for a four department school building.

THE contract for the plumbing for the Athelstan Club building, Mobile, Ala., has been awarded to Thomas Wagner of that city at his bid of $1475.

PRESIDENT FELMLEY and Trustee Charles Capen of the Normal University, Bloomington, Ill., opened the bids for plumbing and laying of 600 feet of water main at the State institution, and the lowest, from Frank Sullivan for $1155, was accepted. The job includes the establishment of ten drinking fountains inside the building, the renewal of the toilet rooms and a general overhauling of the plumbing.

C. BIRKERY, manufacturer and patentee of the Birkery High Pressure Ball Cocks, has opened a brass finishing and general foundry business at 65 Suffolk street, Hartford, Conn. It is Mr. Birkery's intention to make all of his well-known Ball Cocks and specialties at this location, instead of having them made by other concerns, as heretofore.

THE W. J. CLARK COMPANY, Salem, Ohio, are putting upon the market Seamless Melting Ladles made of extra strong plate steel. The bowl and the handle are in one solid piece, the handles being extra long and strong in proportion to the size of the bowl. The bowls are made round with D shaped ends, excepting the smaller sizes. As plate steel withstands heat better than either gray or malleable cast iron, these Ladles last longer and are safer to use than the others. The Ladle bowls are made extra thick, which makes them more durable than the ordinary Ladles. They also have an added advantage in having two pouring lips instead of one, and as the handles are welded solid to the bowls, no rivets being used, they are much more convenient and cleaner than the old style Ladles. The W. J. Clark Company are also manufacturers of the famous Salem and various other styles of Riveted Buckets, Quick as a Wink Hose Couplings, Lane's Joist and Timber Hangers and other patented specialties. Their Ladles are sold through the jobbing houses of Plumbers' Supplies.

THE READING IRON COMPANY, Reading, Pa., have issued an announcement through their New York sales

agent, Pancoast & Rogers, stating that their mills at Reading have resumed operations, and that the difficulties which they have had with their workingmen have been adjusted. They are now in a position to accept orders for Wrought Iron Pipe for steam, gas and water, Boiler Tubes of charcoal iron and steel, Oil Well Casing, Line Pipe, Drive Pipe and special Tubing for ammonia coiling and ice machine work, for locomotive pipes, water grate bars, steam engines, boilers and for a complete line of all other goods which they manufacture.

The State Line Mfg. Company of Chattanooga, Tenn., are sending to the trade an announcement that they have opened an Eastern office at 107 Chambers street and 91 Reade street, New York City, to meet more promptly the demands of a steadily increasing business in the Eastern States and their growing export trade. In addition to Gas Burners for ordinary city gas the company make an extensive variety of Burners for Acetylene Gas.

New Firms and Changes.

William Regan of Concord, N. H., has purchased a plumbing business in Laconia, N. H.

Joseph McKenna of Westerly, R. I., has opened a branch of his plumbing shop on the west side of that town.

Severson & Co. are a new firm in the plumbing, heating and jobbing business at Crawfordsville, Ind. The firm are composed of Claronce Severson, Fred. C. Rowland and Fred. Doherty. Mr. Severson was for 15 years in charge of the plumbing establishment of Wallace Brothers at Lafayette. The new firm have a fine showroom in which modern plumbing fixtures are attractively displayed. They also make an attractive display of Chandeliers and Gas Fixtures.

A. McCreery, who has been manager for H. E. Wieber at Tannersville, N. Y., for the past six years, has resigned his position and opened a plumbing, heating and metal work establishment at that place. Mr. McCreery will be pleased to receive catalogues and price-lists from manufacturers and dealers in goods in these lines.

The Sheet and Tin Plate Strike Situation.

The great strike in the union sheet, hoop and tin plate mills of the American Sheet Steel Company, American Steel Hoop Company and the American Tin Plate Company, inaugurated on July 13, shows no signs of settlement. On the contrary, both sides appear to be preparing for a long struggle. Agents of the Amalgamated Association have been busy in the past week working among the employees of the nonunion mills of the concerns named, with the object of getting them to go out on a strike, but so far their efforts have met with little success.

In the sheet mills the center of interest this week has been in connection with the works of the American Sheet Steel Company at Wellsville, Ohio. This plant has always been nonunion, and two or three days after the strike occurred the Amalgamated Association succeeded in closing it down in nearly all departments. The mill did not remain idle long, however, as a day or so after it was closed Persifor F. Smith, manager, made an address to the men, setting forth how the company had always treated them well, paying them the highest rate of wages and giving them employment when other mills were idle. Mr. Smith's address to the men had a good effect, for on Thursday morning a majority of the men returned to work, and at this writing the Wellsville works are running nearly full. The fact that Mr. Smith's efforts to start this plant were so successful had the effect of disheartening many of the men who had joined the Amalgamated Association, and they severed their connection with it and returned to work. Strenuous efforts have been made in the past week by the Amalgamated Association to get the men in the other nonunion sheet mills of the American Sheet Steel Company, at Vandergrift, Apollo, Leechburg and elsewhere, to go out on a strike, but without success. At this writing all the nonunion sheet mills are running to full capacity and with no signs of discontent among the men. The Wood works, at McKeesport, have been idle for two weeks or more undergoing extensive repairs. These have about been completed, and this works, which is the second largest owned by the American Sheet Steel Company, it is said, will be started immediately. The management anticipate no trouble in getting the men to return to work. With all their nonunion mills running, the American Sheet Steel Company will be able to turn out close to 60 per cent. of their entire capacity.

As far as the tin plate mills are concerned there has been no change in the situation. All the tin plate mills owned by the American Tin Plate Company, with the single exception of the Monessen works, at Monessen, are idle, and the company have made no effort to start them up. The American Tin Plate Company are now receiving the product of the ten mills of the Sharon Tin Plate Company, and this has helped out on contracts.

No effort has been made by the Amalgamated to call out men in other mills controlled by the United States Steel Corporation, nor is it believed there will be. The statement of J. P. Morgan last week, that the course pursued in the strike by the management of the various companies controlled by the United States Steel Corporation had his entire approval, and that there would be no compromise, is construed to mean that the United States Steel Corporation are in the fight to stay to a finish and that any overtures for settlement must come from the Amalgamated. All sorts of statements, and threats as well, are being made by President Shaffer and his followers, but these have had no effect. The officials of the Amalgamated are beginning to realize that when they went into a fight with the United States Steel Corporation they were meeting the strongest organization they have ever encountered, and the belief is spreading that the Amalgamated made a serious mistake when it went into this fight.

The opinion is freely expressed that the Amalgamated Association has made a monumental blunder in going into this strike with the United States Steel Corporation, and that it is doomed to be defeated, entailing a probable disruption of the organization. The officials of the United States Steel Corporation are not paying much attention to the strike at the present time, nor are attempts being made to get idle mills started. It is realized that on account of the hot weather the men desired to rest for a month or so, and some repairs are also necessary at the idle mills. Therefore conditions are not likely to show much change for some time. When cool weather comes the United States Steel Corporation are likely to take up the strike in a vigorous manner and adopt such measures as will soon end it. While nothing official has been given out, it is pretty certain that the Amalgamated Association would not get as favorable terms now as they were offered when the strike first occurred.

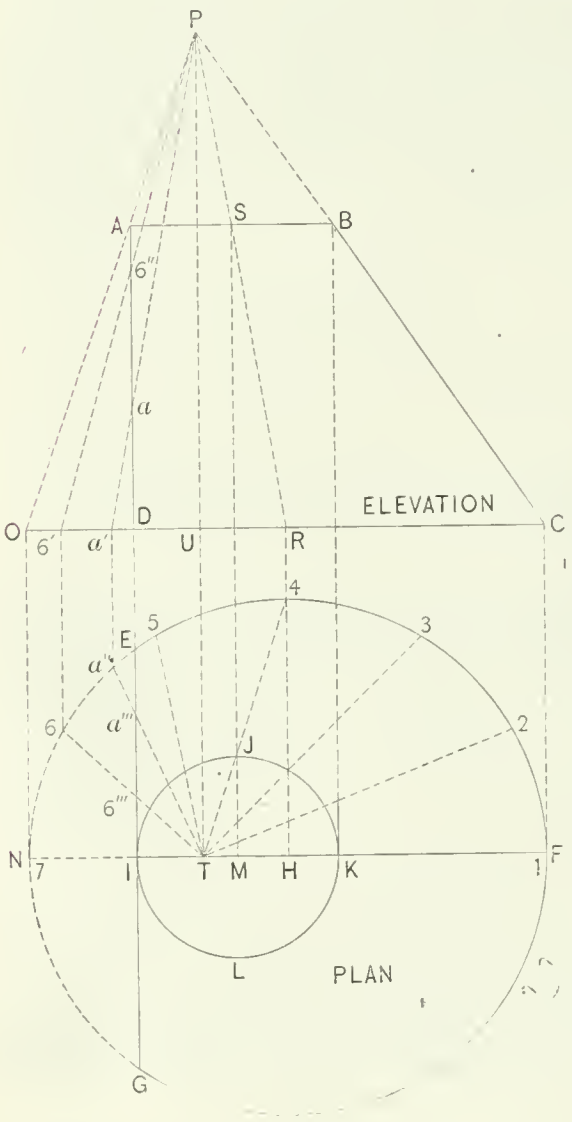
The Woodbine Machine & Tool Company, Woodbine N. J., who are manufacturers of Drive Well Points and Tubular Well Supplies have announced that they have made arrangements with the Gould Mfg. Company of Philadelphia, Pa., to manufacture and sell exclusively their Adjustable Combination Air Force and Testing Pump. These Pumps can, by a simple turn of the thumb nut, throw the cylinder at any angle, adjusting the Pumps for any corner. The Pump can be adjusted so the operator can apply his force to the best advantage. It is an adjustable as well as a combination air force and testing pump. It can be used for testing soil pipe, proving gas mains and it is the best plumbers' force Pump on the market. It is worked with air and water, and there are no stuffing boxes whatever. The company expect that there will be a large sale for these Pumps, and with the increased facilities and most modern machinery which they are going to use in the manufacture, the Pumps will be superior to those which have already given them a reputation. They are in a position to fill orders promptly and will be pleased to hear from the trade.

Envelope of Scalene Cone.

A Minneapolis correspondent wishes us to describe the pattern for the frustum of a cone which is flat on one side, the top opening to be perpendicular to the flat side, as shown in Fig. 1, in which A B C D shows the side elevation of the cone, E F G in plan being the section on D C in elevation and struck from the center H, while I J K L is the plan on A B in elevation and is struck from the center M. E G in plan shows the flat side, on the line D A in elevation.

With H in plan as center, complete the full circle of the base, as shown by G N E, and draw the center line in plan N F. Likewise in elevation extend the base line C D, as shown by C O, which intersect with a line drawn from N in plan at right angles to F N, thus obtaining the point O in elevation. From O draw a line to A, extending it indefinitely, as shown by O P. In similar manner extend the line C B until it intersects O P at P. At right angles to N F in plan and from the center H draw a line intersecting the base O C in elevation at R. In similar manner from M, the center of the circle of the top I J K L in plan, erect a line at right angles to N F, intersecting the top line A B in elevation at S. Draw a line through R and S, which must meet the apex P, as shown, thus making P O C a scalene cone. From P at right angles to O C drop a line intersecting the line N F in plan at T, which is the apex in plan of the scalene cone. Now divide the half plan N 4 F into equal spaces, as shown by the small figures 1 to 7; from these small figures draw lines to the apex T in plan, the radial line 6 T intersecting the flat side E G in plan at 6‴. From 6 erect the vertical line intersecting the base line C O in elevation at 6′, from which draw a line to the apex P, intersecting the side A D at 6″.

For convenience, when getting out the pattern for the flat side establish any point, as *a*, on the line A D in elevation. From *a* draw a line to the apex P, extending it downward until it intersects the base line O C at *a*′. From *a*′ at right angles to O C drop a line, intersecting the circle at *a*″, from which draw a line to the apex T in plan, intersecting the flat side E G at *a*‴. All of these points represent the basis of all measurements required for the patterns.



Envelope of Scalene Cone.—Fig. 1.—Plan and Elevation.

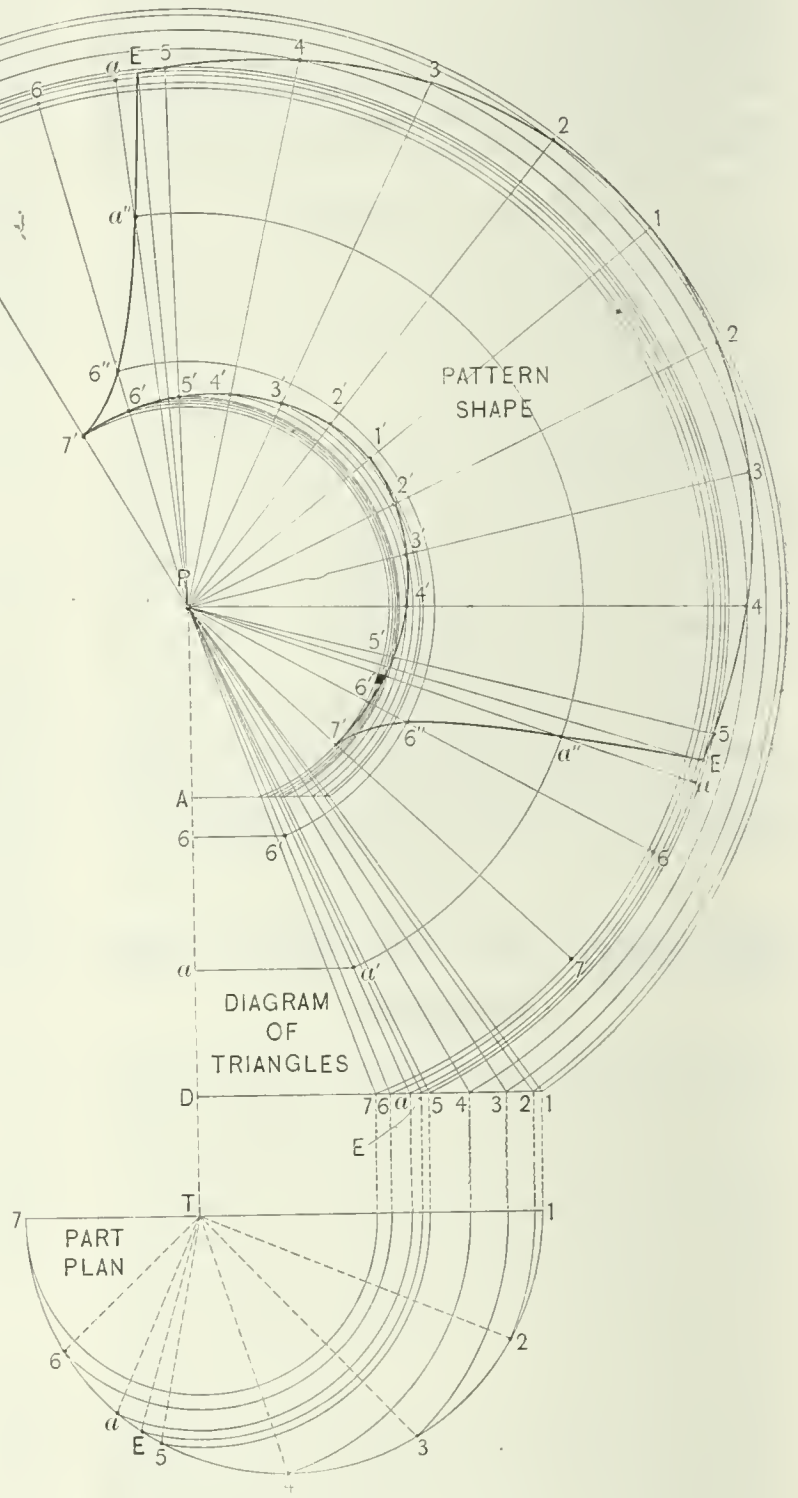


Fig. 2.—Part Plan, Diagram of Triangles and Pattern.

Before obtaining the pattern for the scalene cone first construct the diagram of triangles shown in Fig. 2, in which 1 T 7 4 is a reproduction of 1 T 7 4 reversed in Fig. 1. Take the various divisions 6 *a*″ E 5 4 3 2 1 and place them as shown by 6 *a* E 5 4 3 2 1 in Fig. 2. From these points draw lines to the apex T in plan. Now, using T as center and radii equal to T 7, T 6, T *a*, T E, T 5, T 4, T 3 and T 2, draw semicircles, as shown,

intersecting the center line 1 7, as shown. From these intersections and at right angles to 7 1 draw lines intersecting any horizontal line, D 1, at points D, 7, 6, *a*, E, 5, 4, 3, 2 and 1. Extend the line T D indefinitely to P, as shown. Take the distance from U to P in Fig. 1 and place it as shown from D to P in Fig. 2. Then from the various intersections on D 1 draw lines to the apex P, as shown. Now take the various hights in Fig. 1 from D to *a* to 6″ to A and place them in Fig. 2 on the line D P, as shown from D to *a* to 6 to A. At right angles to D P and from A draw the line A B, which represents the top of the opening.

In similar manner at right angles to D P and from the intersections 6 and *a* draw lines intersecting hypotenuses having similar numbers, as shown by the intersections 6′ and *a*′ respectively. Then will these lines represent the diagram of triangles used in the development of the patterns. For the pattern shape use P as center, and with radii equal to P 7, P 6, *a*, E, 5, 4, 3, 2 and 1, strike arcs indefinitely, as shown. Set the dividers equal to the divisions into which the plan is divided, and starting from the arc 7 step to the arc 6, then to the arc 5, then to 4, 3, 2 and 1, and reverse the operation and step to arcs 2, 3, 4, 5, 6 and 7, as shown. From these points draw lines to the apex P. Next set the dividers

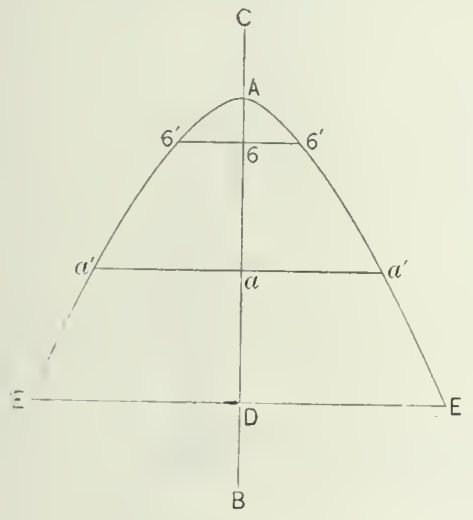

Fig. 3.—Pattern for Flat Side.

equal to the distance 6 *a* in plan, and step from the arc 6 in the pattern to the arc *a*, as shown by *a* on each side. In similar manner take the distance from *a* to E in plan, and step from arc *a* to arc E in pattern on either side. From the points *a* E and E *a* in the pattern draw lines to the apex P. Now with radii equal to P 6 and P *a*′ draw arcs intersecting the radial lines in the pattern drawn from points *a a* and 6 6, thus obtaining the intersections *a*″ *a*″ and 6″ 6″. Finally, with P as center and radii equal to the various numbers 1 to 7 on A B (not shown), draw arcs intersecting radial lines having similar numbers, as shown, thus obtaining the points 7′ to 1′ to 7′. Trace a line through points thus obtained; then will 7′ 6″ *a*″ E 1 E *a*″ 6″ 7′ 1′ 7′ be the pattern shape for the scalene cone.

For the pattern for the flat side draw any line, as B C in Fig. 3, upon which place the distances A 6 *a* D. equal to A 6″ *a* D in elevation in Fig. 1. At right angles to B C in Fig. 3 and through the points 6 *a* and D draw lines, as shown. Now, measuring in each instance from the line N F in plan in Fig. 1, take the distances to points 6‴, *a*‴ and E and place them in Fig. 3 on lines having similar letters and figures, measuring in every instance from the line B C on either side, thus obtaining the intersections 6′ 6′, *a*′ *a*′ and E E. A line traced through points thus obtained, as shown by E A E, will be the pattern for the vertical side of the cone.

Owing to the increased volume of business done by the Western branch of the Berger Mfg. Company at St. Louis, Mo., under the management of S. Y. Buckman, the company have been obliged to remove their St. Louis office and warerooms into more commodious quarters at Nos. 19 and 20 South Main street, where they are in better shape than ever before to conduct business. In a circular to the trade the company state that any orders received will be handled promptly and carefully.

THE TIN PLATE PRODUCTION OF PENNSYLVANIA.

James M. Clark, chief of the Bureau of Industrial Statistics of Pennsylvania, has furnished us with the following statistical data relative to the tin plate industry of that State:

In 1899 Pennsylvania had 21 black plate plants—that is, tin plate plants manufacturing their own black plate for tinning. Eighteen of these plants were under one ownership, five of which were subsequently dismantled and the remaining 13 operated for a part of 1900. Two of the remaining three were run in 1900, making 15 black plate tin works plants operated in Pennsylvania in 1900.

The average number of days of employment was only 201, the occasion of which was a strike which lasted for fully three months. Notwithstanding the dismantling of these five plants, by reason of the better equipment of the live ones the capacity remained practically the same, the output for 1899 being 1017 net tons daily and for 1900 1014 net tons.

The capital invested in these 15 plants was $9,315,000, as against $8,150,000 invested in the 21 plants in 1899. Production of black plate for tinning was 302,928,000 pounds. Of this production 255,844,000 pounds were tinned. The value of the tinned production was $10,561,760, and the total value of the black plate works was $12,197,787.

There were 7069 workmen employed, skilled and unskilled, boys, women and girls. The aggregate amount of wages paid to them was $3,428,259, and the average yearly earnings of all was $484.97. The average daily wage for all was $2.41.

Six tin plate dipping works were in operation during the year—that is, establishments where all black plate is purchased. These plants have 48 tinning sets, with a daily capacity of 194 net tons of tin and terne plate. The capital invested is $451,827. The working people employed were 363, skilled and unskilled, boys, women and girls. The aggregate amount of wages paid to them was $137,700, and the average yearly earnings for all $371.08, with an average daily wage for all of $1.47.

The total production of tin and terne plate by the black plate works and the dipping works combined was 289,392,000 pounds, and the aggregate value $12,669,747.

In the production of black plate for tinning produced at the black plate works there is a falling off from 1899 of 65,672,734 pounds, or 17.8 per cent., which falling off is accounted for because a strike prevailed during 1900 for fully three months. This strike likewise affected the production of the tinned product, which fell off 36,320,734 pounds, or 12.4 per cent.

The average value per net ton of black plate for tinning produced in 1900 was $69.49, an increase over the average value of 1899 of $19.70, or 39.6 per cent. The average value per 100 pounds of the tin and terne plate produced at these works was $14.13, an increase over 1899 of 62 cents, or 17.7 per cent. The average number of workmen employed was 613 loss than in 1899, or a decrease of 8 per cent. The average earnings of all workmen employed were but $484.97, a decrease from 1899 of $42.81, or 8.1 per cent. The average daily wage for all workmen employed was $2.41, an increase over 1899 of 5 cents per day, or 2.1 per cent.

The Marshalltown Iron & Steel Company of Marshalltown, Del., are producing Sheets from No. 16 to No. 28 by the loose rolled plan, which gives them an even black finish. The mills are kept constantly employed in serving a limited number of customers who are anxious to secure their produce. Their factory for making 32 sizes of Sheet Iron Dripping Pans and Stove Pipe and Elbows is also kept running full.

THE SMITH-WARREN HOLLOW METAL WINDOW FRAMES AND SASHES

The hollow metal window frames and sashes, glazed with wire glass, made by the Smith-Warren Company of 143 Federal street, Boston, possess many advantages over the ordinary fire shutters. They always afford free access for light and at the same time offer a positive resistance against the spread of fire. The windows close and lock automatically if left open, in case of fire.

The company have several different types of constructions suitable for different classes or parts of buildings, from the cheapest window having a stationary lower light and vertical sliding (or pivoted) top sash, suitable for areas, factories, stairways, elevator shafts, &c., to one having three weighted sashes, two of which are glazed with wire glass and the third, or inner sash, glazed with clear glass, and provided with a metal fly screen if desired, suitable for use on the principal street fronts of the best class of office, apartment and hotel buildings. The frames can be molded so as to secure

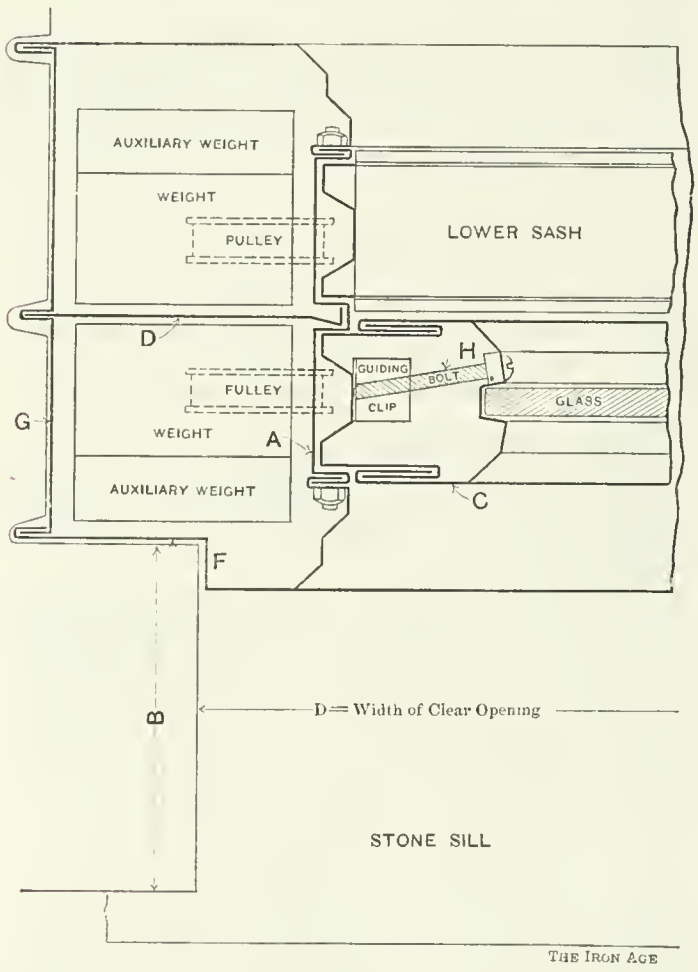

Fig. 1.—Sectional Plan, Showing Construction.

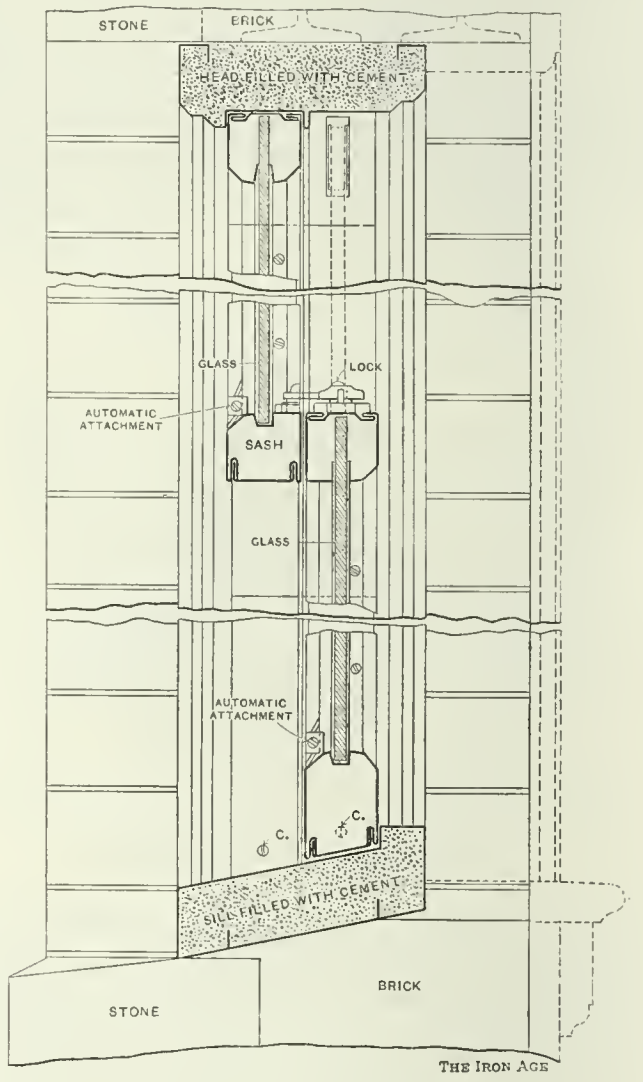

Fig. 2.—Vertical Section.

THE SMITH-WARREN HOLLOW METAL WINDOW FRAMES AND SASHES.

any architectural effect desired, are perfectly straight and true, and there are no joints visible. As the frames are hollow, one side may be heated to a white heat, while the other side remains cool, thus insuring continual structural strength. They can be made with hinged, pivoted or stationary sashes, with or without transoms, single or in groups of two or any number, and can be adapted for use in interior walls, elevator shafts, &c., as well as in exterior walls. The glass fits into grooves formed in the center of the sashes and requires no clips or putty to secure it. The sashes are made of No. 24 gauge galvanized iron or 18-ounce copper; the frames of No. 24 or No. 22 gauge galvanized iron or 18 or 20 ounce copper, according to type of construction, situation, &c.

The first two drawings show one type of construction. The side of the frame consists of parts A, F, G and D, and are joined by locks, as shown. The guiding face A is of heavier material than the other parts and can be easily renewed without disturbing the frame proper. It is made in two pieces with a joint nearly midway between the head and sill. The lower part is secured in place by screws, C, Fig. 2, thus allowing easy access to the weights by its removal. The part D extends the whole length of and entirely through, and serves to stiffen, the frame. The part C of the sash joins the horizontal top and bottom rails and forms a part of the sash frame for holding the glass.

The part B is joined to C by a long sliding lock, as shown, and is held out from the sash and into the guiding face of the frame by bolts H. The sash can be removed by loosening these bolts, which allows B to recede into the sash and out of the frame, thus making the sash narrow enough to allow it to pass out of (or into) the frame, between the stop beads. It will be seen that the sash being adjustable in width, insures a snug fit in the frame. It will be noticed that the wearing parts of both frame and sash are easily renewed without disturbing the body of either, and the peculiar formation of both frame and sash with their locks makes them very rigid.

Fig. 2 is a vertical section showing the head and sill filled with cement, and the method of constructing the top rails of both sashes in two parts, so that the glass can be easily placed into position.

The cap A is made of heavy material, is secured in place by locks, as shown, and can be quickly removed by sliding out at one side of the sash.

The automatic self closing attachment is shown in Fig. 3. In weighted sash constructions the weights of the lower sash are made lighter than the sash, and those for the upper sash heavier, thus causing both sashes to close, and in the window in which one sash balances the other, using no weights, the lower sash is made heavier than the upper, which causes the lower sash to descend and the upper sash to ascend, thus closing the windows. But in order to hold the sashes open when desired a friction is provided at the side of the sash against the frame, thus compensating for the difference in weight between the sash and its balancing weights, which hold the sash in any position desired.

This friction device will be understood from the following: A square tube, A, is secured permanently in the side rail of the sash. A movable hard wood friction shoe, B, slides in and projects from the end of the square tube A and comes in contact with the side of the frame. This friction shoe is pressed outward by the spring C, the pressure of which is regulated by the position of the nut D, the position of which is changed by turning the bolt E, which is held in the square tube by the detachable cap F. A part of the bolt head projects through the cap so that it can be turned with a screw driver, thus regulating the pressure of the spring. The detachable cap F is held in place by solder that melts at between 150 and 180 degrees F. It will be seen that if the windows are open, in case of fire the fusible solder will melt, releasing the detachable cap which will release the bolt and spring, thus removing the pressure of the friction shoe B from the side of the frame, and as there is then no obstruction the sashes close. The attachment is small and is partly concealed within the hollow space of the sash, thus not being noticeable in the appearance of the windows.

The automatic lock is illustrated in Fig. 4. A piece of malleable cast iron, A, is pivoted in the muntin of the upper sash and projects through the muntin at its lower end, the weight of the lock being distributed with reference to its pivot so as to keep this end projecting out of the muntin at all times without the aid of a spring. The cast iron plate B is riveted on the top of the lower sash and has upwardly projecting lugs, D, between which A passes. An iron wedge, C, is inserted between the lock A and lugs D on the plate B, and by pressing the wedge into place the meeting rails of the sash are brought closely together, the upper sash is forced up and the lower sash down, thus tightly closing the windows and making a burglar and weather proof fastening. To open the windows it is only necessary to remove the wedge C and press the lock A back into the muntin with the finger, when the sashes may pass each other.

When the window closes automatically (if left open in case of fire) the lock A will move out of the muntin and over the lower sash, thus holding the windows securely locked independent of the chains. Should the chains fuse or elongate on account of the heat, the windows will remain closed.

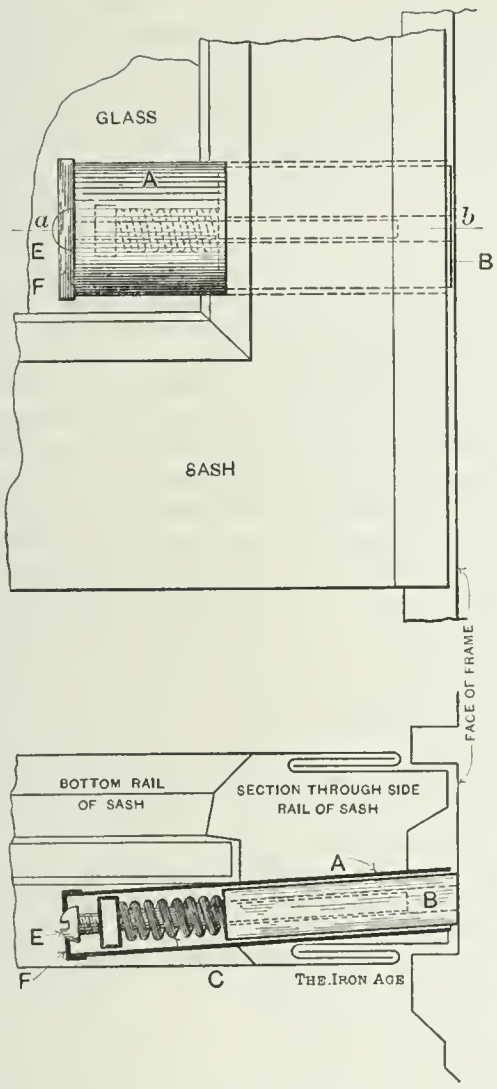

Fig. 3.—Automatic Self Closing Attachment.

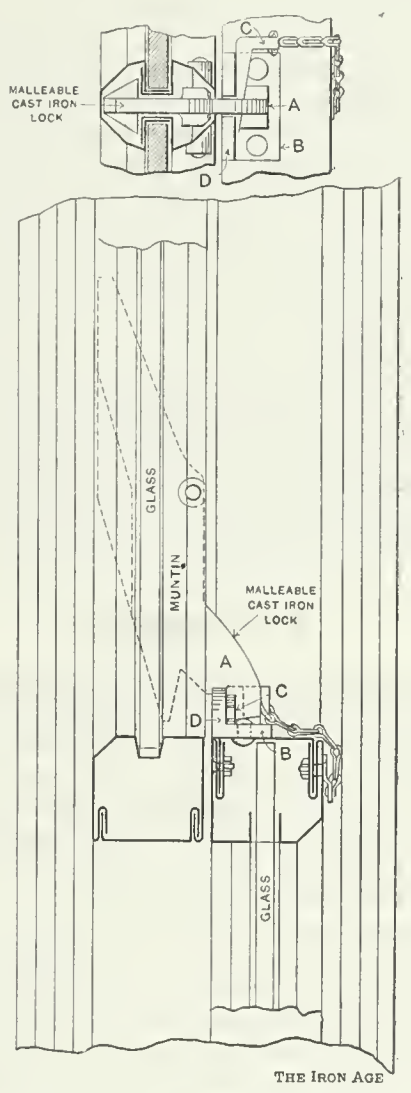

Fig. 4.—The Automatic Lock.

Architectural Sheet Metal Work.

The Edwards Mfg. Company, formerly the Art Metal Relief Company, York street and Pike, Covington, Ky.,

THE SMITH-WARREN HOLLOW METAL WINDOW FRAMES AND SASHES.

are sending out a catalogue of 84 pages illustrating an extensive assortment of sheet metal work which they are prepared to furnish on reasonable notice. In size it measures 9¼ x 11¾ inches, thus giving opportunity for the use of large engravings, or for a number of small ones upon each page. In presenting the catalogue to the trade the company refer particularly to their spun work and to their varied line of stamped ornaments. They also call the attention of architects, builders and owners of buildings to Weitzel's Polygon sheet metal conductor pipe, which is expansive and so constructed, it is claimed, that ice forming in it will not, by slipping, burst the joints and seams, but will descend gradually without injury to the pipe. The claim is also made that water during heavy rains will discharge more freely, as the pipe will not choke. Designs of finials, urns, cornices, belt courses, moldings, crestings and enrichments, rope and bead moldings, shells, panels and gable ornaments, wreaths, garlands, points, drops and scrolls, rosettes, ventilators, animal heads, flagstaff ornaments, fountains, leaves, modillions, brackets and capitals are

shown in profusion. The catalogue concludes with an index arranged by numbers rather than alphabetically.

A New Method of Rolling Sheet Metal.

Albert J. Demmler of Wellsville, Ohio, has recently been granted a patent on a new method of rolling sheet metal which he has invented. Through this new method Mr. Demmler claims to succeed in overcoming certain disadvantages in the methods heretofore employed, and it is also designed to simplify and cheapen the heating and rolling of packs of sheets. He carries out his object by heating the packs of sheets in bulk to a proper and even temperature throughout, carries the heated packs in bulk and feeds the sheets directly from the heated pack to the rolls.

The packs of sheets are heated preferably in a muffle furnace or an annealing box. When using an annealing box, the latter is formed by means of a plurality of slabs, each of which is designed for the support of a pile of sheet packs, whereby each pile may be carried in bulk upon the adjacent slab from the oven to the rolls, a suitable case or cover being applied to the pile during the transportation from the oven to the rolls and capable of being readily removed to permit of the sheets being individually fed to the rolls, it of course being understood that the slab remains in the meantime upon a suitable hot bed.

By this method, the furnace may be operated by unskilled labor, as there is no danger of the entrance of soot or sulphur and other injurious elements between the sheets, and although the time of heating may be longer, yet by a proper arrangement of the rolls with respect to the heating oven a practically continuous operation may be had and the output materially increased.

FLASHINGS.

Albert Niceer has opened a Tinsmithing shop and House Furnishing store at Pennsville, N. J., where he will do all kinds of Tin Work, Roofing and Spouting.

A company are being organized with a capital of $1,500,000 to work the Tin deposits in the Greenbushes district of Western Australia. The prospectus of the company makes very flattering promises regarding the prospects of success in this venture.

The Jackson Iron & Tin Plate Company have been incorporated with a capital stock of $300,000 at Clarksburg, W. Va., by C. C. Moore of Elkhart, Pa.; Col. T. Moore Jackson, Dr. Fleming Howell, C. S. James, Lynn S. Horner and others. The erection of an eight-mill plant will be begun at once. The citizens of Clarksburg have donated ground for the works.

A report from Sharon, Pa., states that large stamping works will be erected at New Castle, Pa., at a cost of $1,000,000. The corporation operating the works will be known as the New Castle Stamping Company. All kinds of Enameled Iron Ware will be manufactured. Application for a charter has been made by G. L. Patterson, T. F. Morehead, Charles J. Kirk, Leander Raney and A. W. Oberman.

It is reported that a company are being organized in Baltimore to operate on a large scale the Slate fields of the Peach Bottom district. It is stated that the new company will have a capital stock of $200,000, and that they will acquire about 100 acres of the best Slate land in the Peach Bottom region, installing the latest improved machinery.

The Alcania Company of Pittsburgh have applied for a charter of incorporation and propose to manufacture Sheets, Wire, &c. This concern have a small Tin Plate plant running at the present time in the Pittsburgh district.

In the construction of the new buildings now approaching completion at the Brooklyn Navy Yard glass has been employed to a greater extent than usual. The side walls have a brick base with glazing above, and put on in bevels or sections which are capable of being swung out to provide ventilation. The side walls of the clearstory are of Corrugated Iron with glazing above. The bulk of area of the shed roofs is Skylight, and wide Skylights are also placed in the clearstory roof.

The George A. Hogg Iron & Steel Foundry Company, Pittsburgh, manufacturers of Rolling Mill Machinery of all kinds, are equipping the Humbert works of the American Tin Plate Company, at Connellsville, Pa., with the Freeman patent annealing furnace chargor.

The friends of the Standard Paint Company, manufacturers of the P & B Goods, New York and Chicago, are receiving through the mails a very cordial invitation to not only visit the P & B pavilion at the Pan-American Exposition, but to make it their headquarters for keeping appointments, receiving mail, &c. The convenient location of the P & B pavilion near one of the gates of the exposition and the unique character not alone of the exhibit itself but of the handsome building in which it is placed are attracting many visitors. The pavilion is constructed entirely inside and outside, walls, ceilings and floors, of the Ruberoid Roofing made by the company. Ruberoid enjoys the distinction of occupying one of the seven or eight of the individual exhibition buildings at the Pan-American. The pavilion is the one which attracted so much attention at the Paris Exposition.

Peace has been secured in the Welsh Tin Plate trade for a further period of 12 months. At a joint meeting of the workmen and the employers held at Swansea recently, it was agreed that the present wage scale shall continue until June 30, 1902, on the condition that the representatives of the men guarantee that the wage rates be made uniform, it being stated at the meeting that some of the manufacturers were obtaining unfair advantages in that way. The required pledge was given by the men's representatives. Arrangements were made for the consideration of any grievance that might arise during the next 12 months by a joint wages committee.

The Illinois Roofing & Supply Company, 23 Lake street, Chicago, are issuing illustrated circulars calling attention to their specialties. One refers to Roofing, Spouting and other goods used by roofing and cornice makers, Metal Ceilings, Galvanized and Black Sheets, &c., while another treats exclusively of Tin and Terne Plates, enumerating the brands handled.

The David H. Wells Company have been incorporated at Wilmington, Del., with a capital of $15,000, to deal in Tin Plate and Sheet Iron, do a Roofing and Cornice business, and to handle Furnaces and Ranges.

The Bangor Crescent Slate Company of Bangor, Pa., are manufacturers of Roofing, Structural and Marbleized Slate, Plumbers' Slate, Electric Slate, besides furnishing the roofer with all kinds and grades of Pennsylvania Black, Genuine Bangor, Albion Bangor, Big Bed Lehigh, Chapman Hard Face and Peach Bottom. They are also prepared to furnish the plumber with Urinal Stalls, Shower Stalls, Closet Stalls, Laundry Stalls, Sinks, Slop Hoppers, Lavatories, Floor Slabs for water closets and bathtubs, Sink Wastes, &c. The company claim it shall be their aim to furnish the best materials for all of the above mentioned purposes, and that at reasonable prices to the trade. They request that they shall be written to before asking for prices, so that the trade may be convinced of their ability to furnish all kinds of goods in these lines.

United States Consul Hughes, at Coburg, Germany, in a letter to the State Department says that the Imperial German navy and some German manufacturers are using large quantities of "masut," an oily product of German brown coal tar, for heating and steam producing purposes. The advantages over coal are stated as follows: "The heat producing qualities are said to be one-fourth greater than those of coal; the oil is easier to handle, it being only necessary to open a valve. Very little smoke comes from its use, and steam can be produced and full power reached in less time. The coast defense vessels of the German navy are fitted for the use of this oil and some of the battle ships and cruisers are also arranged so that they can use both coal and 'masut.'"

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

COATING A GALVANIZED TANK.

From "Experience," New York City.—I notice the letter of "A. L. B.," in *The Metal Worker* of July 13 in reference to coating a galvanized tank, and also the recommendation of "J. R. Q.," on July 20, to use a good quality of asphaltum varnish. I subscribe to the idea presented, that a galvanized tank is not a desirable one for the storage of drinking water. From long experience I know that it is difficult to get paint to stick to galvanized iron. If the surface can be left exposed to the weather until it becomes dark in appearance and the action of the atmosphere roughens it somewhat so that paint will adhere, it is more than likely that it will hold for some time if the right kind of paint is used. If, on the other hand, the tank must be painted as soon as completed, it should be washed with a strong soda water, or with soft water to which some ammonia has been added, and then cleaned with clear water. A still better wash is dilute muriatic acid, which will on drying produce a grayish film that should be washed off with clear water and the surface allowed to dry before beginning to prime.

As to a paint for the first coat on galvanized iron, beware of white lead, because it remains soft and eventually peels off, and of zinc white, which will crack and flake, or any light carbon paint which requires much oil to spread, because this will wrinkle and later on part. The cheap, ordinary mineral paints will not serve the purpose either, because they are liable to peel. Red lead as the basis for an all oil paint has given best service, but it, too, has given away at times. The cause of the trouble appears to be that in an all oil paint the oil is attacked by the metallic zinc. After many trials I have found that a paint made from a heavy pigment that requires a small percentage of thinner for spreading will best serve the purpose of first coating galvanized iron. The most desirable results have been obtained from a good mixture of equal parts by measure (not weight) of dry lead and first-class mineral brown ground together dry and then mixed by hand with equal parts of pure raw linseed oil and spirits of turpentine, without the use of any japan or liquid dryer. Over this priming coat any good oil paint may be applied and permanent adherence expected.

A solution for washing galvanized iron used by an old acquaintance who vouches for its excellence is as follows: Dissolve 2 ounces of chloride of copper, 2 ounces of nitrate of copper and 2 ounces of sal ammoniac in 1 gallon of water; then add 2 fluid ounces of crude hydrochloric acid. This solution must be made up in stone or earthen ware to prevent precipitation of the copper salts. Cover the surface of the galvanized iron with the solution and it will assume a black color, which on drying over night will turn light gray. Upon it a red lead prime, thinned with equal parts of raw linseed oil and turpentine, will hold indefinitely. Subsequent coats can be given in colors, rich in oil. Galvanized iron should at no time be first coated with an all oil paint.

REESE'S SOLDERED STANDING JOINT.

From M. C., New York.—I would like to ask if Reese's soldered standing joint, as illustrated in *The Metal Worker* of July 13, is any different from the regular standing groove roof that has been used for so many years, also if the Reese patent interferes with putting on the old standing groove roofs, either on sheathing or over shingles?

Answer.—We have referred this question to Henry O. Reese of the firm of E. L. Parker & Co., Baltimore, Md., the patentee, who replies as follows: "Reese's soldered standing joint differs from the regular standing joint only in the second turn, which is reversed from the old way and then soldered. My patent does not interfere with the old way of putting on any kind of roof."

TROUBLED BY WALL SWEATING.

From B. W., Innerkip, Ont.—I have a customer who has a rough cast hollow wall house. It is finished with lath and plaster on the inside and has the same finish on the outside. The walls sweat so much in the winter time that the bed clothes become wet and water can be scooped up on the floor. The house is of frame construction and is girt half way up the side of the building. The front is one and a half story, while the kitchen is but one story in hight. There is just as much trouble in the kitchen as in the front room from the sweating. The walls are hollow from top to bottom. On one side there is a row of five maple trees 20 feet from the house. On the other side there is a driveway between the house and another row of five trees from 35 to 40 feet from the house. Can it be that the trees cause the trouble? I should be glad to have any assistance possible toward remedying it.

Note.—The sweating is caused by the walls being cooler than the atmosphere of the room, which induces the moisture contained in the air to condense. Where moisture is precipitated in such a quantity as mentioned it is owing to excessive moisture in the air. In the winter season the walls naturally are cooler than in the summer, which would induce a quicker condensation. Inasmuch as the doors and windows are closed in the winter season, the amount of moisture in the air can be controlled by the occupants of the building. If a tea kettle is kept on the cooking stove and the stove is used for boiling and preparing food or for any domestic work of that nature, considerable steam will be made, which will be taken up by the air in the room and deposited wherever the air comes in contact with a cool surface. Not having detailed information as to the cause in the case in question, we give this explanation of what would ordinarily cause condensation, and probably our correspondent can devise a remedy from the information presented.

WILL PIPE COVERING STOP SWEATING?

From J. A. M., Baltimore, Md.—I notice the inquiry of "G. E. S.," in *The Metal Worker* of July 20. The first point is to find what causes the sweating. This is not difficult in view of the excessively humid weather that has prevailed in this section of the country for some time. The water pipes in the basement of a building are naturally cool—much cooler than the atmosphere, particularly if water is flowing from the street mains and passing through the pipe. When air which has a large percentage of moisture in it comes in contact with these cold pipes the moisture rapidly condenses and the water will run down and cause annoyance. In order to avoid this annoyance some insulating material must be provided to prevent the air from coming in contact with the cool pipe, and any of the good pipe coverings are well adapted for the purpose, particularly those of a fibrous construction. If hair felt is used on the pipe and this is covered with canvas, the trouble will be overcome, so far as the summer season is concerned, and a very effective protection against the effect of frost in winter weather will be provided.

ACCOUNT OF PLUMBERS' TIME.

From C. H., Plymouth, Mich.—I should be glad if some of the readers of *The Metal Worker* would give me the benefit of their experience as to the best plan for keeping an account of plumbers' time. A simple and not too complicated system is one that I am in search of, suitable for a small jobbing shop.

Note.—This is a subject that will interest many of our readers, and we shall be glad to receive information from those who are using some plan for keeping account of a workman's time which they have found practical in operation.

RAIN WATER CUT OFF.

The Martin Roof Washer Company, Springfield, Mo., send us a circular of their roof washer and state that if "W. F. C.," who inquired for a rain water cut off in *The Metal Worker* of June 8, will address them, they will send him their circular, when he can see if their device will answer his purpose.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and ½c. lower.

Copper is unchanged and dull.

Pig Lead is in moderate demand and unchanged in price.

Spelter is very dull and rather weak.

Antimony is inactive and unchanged.

Nickel is still strong and scarce.

Aluminum continues in good demand at former prices.

Tin Plates are growing very scarce; jobbers have advanced prices sharply.

Sheets are also scarce and demand pressing; prices are advancing for both Black and Galvanized.

Old Metals are dull and weaker.

Pig Iron is irregular but with good statistical position; prices are no lower.

Hardware is less active, but prices continue firm.

Plumbers' Supplies are moving in fair volume with prices on the up grade.

Wrought Iron Pipe is still scarce and strong in price, with prospect of further advance.

Enameled Sanitary Ware is also in short supply, with prices unchanged.

Tin Cans have been marked up 10 per cent.

Wire Nails are in good demand at unchanged prices.

Cut Nails in small lots are firm.

Wire continues in large demand and firm in price.

White Lead is in fair demand; prices firm, but no higher.

Linseed Oil is still high in price and in moderate demand.

Spirits Turpentine rules about ½c. a gallon lower.

METAL MARKET.

New York, July 26, 1901.

Pig Tin.—During the week a sharp decline in the price of Pig Tin occurred both in the London market and here. Notwithstanding an effort in London to boost up the market, prices here refused to respond, and closed from ½c. to ¾c. lower than those ruling a week ago. Jobbers quote Straits Pig in small lots at 27¾c. to 28¼c. per lb. The strike, which has resulted in closing up nearly all the Tin Plate mills of the country, has had a depressing effect upon the market as temporarily cutting off the largest consumers.

Copper.—Quotations on Copper are nominally unchanged, but there are some persistent rumors that prices have been cut in some quarters from ¼c. to ½c. a lb. There is hardly any demand from home consumers, and the export demand is of the smallest. It is stated that Europe is shipping here and that the business of importation is quite remunerative. This is a new feature of the market. Exports to Europe are steadily decreasing in volume this month. For the first three months they amounted to barely 4800 tons, as compared with 10,861 tons in the same period a year ago. Lake Ingot in small lots is quoted at 17¼c. to 17½c. per lb. and Casting Copper 16¾c. to 17c.

Sheet Copper.—There is no change in respect of this material. A very fair demand continues and prices remain firm on the basis of 21c. per lb. for moderate sized lots of Sheet Copper from store.

Pig Lead.—No change whatever has taken place in the Lead situation. Business is on a hand to mouth order and prices are the same as have been maintained for several months past, small lots of American Pig being quoted at 4.60c. to 4.62½c. per lb.

Spelter.—This market is still very dull as far as demand is concerned. There is a little side play of interest going on, however, between two large interests, one in New York and the other in St. Louis. The latter concern are trying to ward off the doubt in the article and are disposed toward seeing good round figures named, while the local concern, it is said, are trying to make good past transactions by bearing the metal. Good Western brands in small lots are quoted at 4.45c. to 4.50c. per lb. in New York.

Sheet Zinc.—A fair demand for Sheet Zinc is reported and jobbers quote 600-lb. cask lots at 6¾c. per lb., and smaller quantities at 7¼c.

Antimony.—Business is not active and prices are unchanged. Cookson's in small parcels is quoted at 10½c. to 11c. per lb., and Hallett's at 8¾c. to 9½c.

Nickel—Is firm and without change. Small lots are quoted nominally at 60c. to 65c. per lb.

Aluminum.—The demand for Aluminum continues active at former prices—viz., 37c. per lb. for small lots of No. 1 Ingot guaranteed 99 per cent. pure, and 35c. for 100-lb. lots.

Tin Plates.—The Amalgamated Association strike, which has resulted in the closing down of practically all the Tin Plate mills of the country catering to the trade at large, has caused a complete demoralization of the market. The scarcity referred to in our last report is daily becoming more pronounced. In some lines, notably in Coke Tins of the more popular sizes, there is already an absolute famine. Some of the jobbers and larger consumers, being unable to secure deliveries from the American Tin Plate Company, have been forced to place considerable orders abroad, and this action has caused prices of Welsh Tin Plates to advance from 1 shilling to 1 shilling 6 pence per box for 100-lb. Cokes. The few jobbers who are fortunate enough to have any considerable stocks on hand are getting fancy prices for their Plates. Instances have occurred during the past week in which small lots of Plates were sold to consumers absolutely obliged to obtain supplies, at from $1.25 to $1.50 per box above the prices ruling a week or ten days ago. With the jobbers it is no longer a case of looking for business, but rather of warding off customers who are clamoring to have orders filled and who are willing to pay fancy prices to obtain the material they urgently need. One hundred-lb. Cokes are the scarcest article in the market at present and are sold in small lots at an advance of nearly $1.50 per box. Prices under the circumstances are hardly quotable, as they depend entirely on conditions of sale, quantities in stock, urgency for shipment, &c. But it would be safe to say that, taking the whole list of Tin and Terne Plates, there has been an advance during the past week, made by Eastern jobbers, of fully $1 per box, with every prospect of prices mounting still higher. American Bessemer Coke Plates, I C, 14 x 20, are to-day being quoted in small lots (which is the only way in which they can be bought) at about $6.10 to $6.25 per box, and I X at $7 to $7.25. A similar, but not so radical, advance has also been made in Bright Charcoal and Terne Plates.

Anticipating the strike the American Tin Plate Company a few weeks ago sent out circulars to the trade announcing that they were practically sold up to October 1. As a result everything in sight was snapped up by the dealers and the larger consumers, and now the only orders booked are for October, November and December delivery, which the American Tin Plate Company are taking at former prices, but without any guarantee as to time of shipment.

Sheets.—The shut down of so many of the Sheet mills has caused a sharp advance in the prices of Black and Galvanized Sheets. Jobbers who can ship out from stock are able to obtain almost what they choose to ask for spot deliveries. The independent Sheet mills have advanced their prices for deliveries within the next three months about $4 to $5 a ton over the quotations made by the leading Sheet interest before the strike was declared. While the American Sheet Steel Company claim that they are operating 60 per cent. of their capacity and all the Sheet mills outside the combine are running full, it is practically impossible to get prompt delivery of Sheets at any price, as all the mills, even before the strike, were away behind with their deliveries on orders. Meanwhile, the demand for Sheets continues as heavy as ever, and the shortage of the supply is likely to be still more seriously felt as time goes on, unless the trouble is settled within a very short time. There is no evidence, so far, of any orders for Black Sheets having been placed abroad, but there is every likelihood that business will go over to the other side of the water within a short time if the strike is likely to be prolonged. New York jobbers during the week advanced their retail prices on Black Sheets about 20 cents per 100 pounds. No. 27 One Pass Cold Rolled Soft Steel Sheets are now quoted at about 4.10c. to 4.15c. Galvanized Sheets are very strong and continue in good demand, with growing scarcity. Prices on these goods, however, have not risen, so far, in proportion to those on Black Sheets. Jobbers are still quoting Galvanized Sheets at 62½ and 5 per cent. to 65 per cent. off the list.

Chicago advices are as follows: As it is very difficult to secure anything but promises from manufacturers, the jobbers are having a huge business from store. Stocks are already badly broken and it is impossible to secure some sizes. Prices are advancing, as might be expected, and the minimum quotation on No. 27 Black is 3.60c., with some houses holding firm at 3.75c. and even 3.80c. Galvanized Sheets may be had to a limited extent at 70 off, but most jobbers are quoting 65 and 5 off, while in some cases 65 is strictly adhered to. Tin Plates are held at a premium. Shipments from mills cannot be had and Coke Plates are getting particularly scarce.

Old Metals.—Labor troubles have interfered to some extent with the demand for Scrap Iron, and the demand is light, with prices rather soft. Old Metals are dull and weaker. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 14¾c.
Light and Tinned Copper	per lb. 13¼c.
Heavy Brass	per lb. 10 c.
Light Brass	per lb. 8 c.
Lead	per lb. 4 c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 18½c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	$6.00
Wrought Iron Scrap, per gross ton	$10.50 to 11.00
Heavy Cast Scrap, per gross ton	10.00 to 10.25
Stove Plate Scrap, per gross ton	7.00 to 7.50
Burnt Iron, per gross ton	5.00 to 5.50

THE PIG IRON MARKET.

NEW YORK.—The market has been very dull and there are renewed reports of lower prices made by some Southern interests. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, $16 to $17.50; No. 2 X, $14.75 to $15.75; No. 2 Plain, $14 to $14.50; Tennessee and Alabama brands, No. 1 Foundry, $14.50 to $15; No. 2 Foundry, $14 to $14.50; No. 1 Soft, $14.50 to $15; No. 2 Soft, $14 to $14.50; No. 3 Foundry, $13.25 to $13.50; No. 4 Foundry, $12.75 to $13.25.

PHILADELPHIA.—There has been a very good demand, considering the unsettled condition of things in the West, and prices have been easily maintained at the full figures of last week. Sales include all the various grades of Foundry Irons. Deliveries are well taken, and some of the furnaces are hard pushed to make shipments as quickly as desired. Locally, therefore, the situation is entirely satisfactory, and if it were not for the strike uncertainties the chances would seem to favor better prices, but in the meantime sales are made at about the following figures for deliveries, Philadelphia and equivalent points: No. 1 X Foundry, $15.75 to $16; No. 2 X Foundry, $15 to $15.25; No. 2 Plain, $14.25 to $14.75.

CHICAGO.—A number of commission houses report practically no market. Others have had a little more business than the previous week, but they could have had a great deal more and still have found trade far from active. The buying from the country foundrymen is somewhat better. Prices are well maintained under the circumstances. The local furnacemen are still so well supplied with orders that they are maintaining old prices. We quote as follows:

Lake Superior Charcoal	$17.00 to $18.00
Local Coke Foundry, No. 1	15.50 to 16.00
Local Coke Foundry, No. 2	15.00 to 15.50
Local Coke Foundry, No. 3	14.50 to 15.00
Local Scotch, No. 1	15.75 to 16.25
Ohio Strong Softeners, No. 1	16.00 to 16.50
Southern Silvery, according to Silicon	14.90 to 15.15
Southern Coke, No. 1	14.65 to 14.90
Southern Coke, No. 2	14.15 to 14.40
Southern Coke, No. 3	13.65 to 13.90
Southern Coke, No. 1 Soft	14.65 to 14.90
Southern Coke, No. 2 Soft	14.15 to 14.40

PITTSBURGH.—The Pig Iron market is absolutely lifeless. None of the consumers of Iron are buying and there have been no sales on which to base prices. There is no pressure on the part of the furnaces to sell Iron. We quote Bessemer Pig, nominally, at $16; No. 1 Foundry, $14.50 to $15; No. 2, $14 to $14.50; No. 3, $13.75 to $14, f.o.b. Pittsburgh.

CINCINNATI.—The situation in Pig Iron is a rather puzzling one. The good selling as told of in last week's report indicated a good strong market, but the trade of the week just past did not carry out the promise. There was no selling in round lots and only the customary run of retail business. In response to some inquiries some pretty low prices have been brought forward. Nominally the quotations are unchanged, though in point of fact the minimum figures have been shaved as much as 25c. The inquiry has dropped away and everything is again dull. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$13.50 to $13.75
Southern Coke, No. 2	13.00 to 13.25
Southern Coke, No. 3	12.25 to 12.75
Southern Coke, No. 4	11.75 to 12.00
Southern Coke, No. 1 Soft	13.50 to 13.75
Southern Coke, No. 2 Soft	13.00 to 13.25
Southern Coke, Gray Forge	11.75 to 12.00
Southern Coke, Mottled	11.75 to 12.00
Ohio Silvery, No. 1	15.50 to 16.00
Ohio Silvery, No. 2	14.50 to 15.00
Lake Superior Coke, No. 1	14.50 to 15.00
Lake Superior Coke, No. 2	14.00 to 14.50
Lake Superior Coke, No. 3	13.50 to 14.00
Southern Basic	13.75 to 14.00

CHICAGO REPORT.

Scrap Iron and Steel.—Business is quiet. Borings and Turnings are a little higher in price because of the machinists' strike, which cuts down the supply. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap	$10.50 to $11.00
Machinery Cast	10.00 to ....
Malleable Cast	10.00 to 11.00
Stove Plate (free from burnt)	7.00 to 7.50
Burnt Iron and Grate Bars	5.50 to 6.00
Sheet Iron and Hoops	6.00 to 7.00
Plow Steel	9.00 to 10.00
Breaking Stock	9.00 to 9.50
No. 2, such as Shovels, Hoes, &c	.... to 7.00
Old Boilers—whole (Iron)	.... to 7.00
Old Boilers (Iron) cut in single Sheets and Rings	9.50 to 10.00
Old Gas Pipe and Boiler Tubes	9.50 to 10.00
Cast Borings	3.75 to 4.00
Turnings	8.50 to 9.00
Horseshoes	11.00 to ....

Old Metals.—The demand is still light, being even less than last week, and prices are lower. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	14½c.
Copper Bottoms	13¼c.
Copper Clips	14 c.
Red Brass	13¼c.
Yellow Brass	10 c.
Red Brass Borings	11½c.
Yellow Brass Borings	9 c.
Light Brass	7¾c.
Pipe Lead	4 c.
Tea Lead	3½c.

Zinc	2¾c.
Pewter, No. 1	19 c.
Pewter, No. 2	10 c.

Old Rubber.—The market is extremely dnll. Buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$23.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7¾c.
Rubber Car Springs	....	4¾c.
Inside Bicycle Tubing	....	21 c.
Outside Tubing	....	7¼c.

Rags.—Buying price of good conntry Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—A heavy bnsiness is in progress and Egg is very scarce. Another advance will be made Augnst 1. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.25	6.50
Kansas City, Mo	8.25	8.50

A discount of 20c. from these fignres is allowed on all Coal ordered to be shipped in Jnly.

THE HARDWARE TRADE.

The trade throughout the country are feeling the effects of midsummer with its naturally dimlnished trade, owing in part at least to the presence of the vacation season and the prevalence of hot weather. Notwithstandlng these influences business continues in very good volume. Manufacturers report a large number of orders from both the jobbing and retail trade, bnt in most cases these orders are for moderate rather than heavy qnantitles. There is among the trade in general no serious distrust as to the steadiness of prices, and buyers are therefore covering their wants with reasonable liberality. In a few lines, especially those connected with the Wire industry, there is a disposition to purchase quite conservatively, as an impression is abroad that a reduction in price would not be surprising in view of the amount of competition which has developed and is either in the market or preparing to enter the market soon. In regard to Hardware, Heavy and Shelf, there is, however, a general feeling that the condition of the Iron market and the existing prosperity, which promises to keep business active and its volume large, will secure a substantial maintenance of prices on about the present level. This is on the assumption that there is no important disturbance, commercial or financial. The conrse of the strike of the Steel workers is closely watched and it is recognized that its long continuance would have an nnpleasant effect on the market, interfering with business and perhaps causing a scarcity of materlal, which would be embarrassing in certain lines. The crop situation is the object of much solicitnde, but, while it is to be feared that certain sections may suffer on account of the drought, it is substantially assured that the crops on the whole are snch as will secure the agricultnral classes a more than average retnrn and fnrnish a basis for continued general prosperity.

NOTES ON PRICES.

Wrought Iron Pipe.—There seems to be no improvement whatever in the condition of the Wrought Iron Pipe market. Scarceness of all of the sizes heretofore reported still continnes. The National Tube Company are said to be turning down orders from the smaller jobbers, and only the large ones who are known to bny exclusively from the combination are getting the preferred shipments. The threatened trouble at the mills has been averted by the company increasing wages 10 per cent. before a formal demand was made upon them by their workingmen. It is expected that an advance in prices will soon be announced and that the excuse given for this advance will be the recent increase in the salary list. The fact that the large jobbers covered themselves very extensively at prices ruling some time ago has acted more or less to retard an advance in prices by the mills, as until the mills have practically cleared np their orders, the jobbers wonld not take advantage of the advance if it were made. The jobbers in this vicinity have agreed upon prices to be charged for all Wrought Iron Pipe in quantities less than carload lots, and from what we can learn these prices are being rigidly adhered to. In fact in some cases the jobbers are demanding higher prices than those agreed upon by the association.

Solid Porcelain Earthenware.—The demand for Solid Porcelain Earthenware continnes unabated. It is nnderstood that two of the Trenton potters are to erect kilns which will increase their output at least 50 per cent. This additional kiln capacity will be used exclnsively in the manufactnre of goods used by the plumbing trade. The potteries are all sold out for the next three months, but prices have remained the same. We understand that efforts are being made to bring abont an eqnalization of prices among the different manufacturing potters. One of the elements which have militated against snch a scheme being put through heretofore was the fact that so many pieces of ware coming from the kilns are of the B or C quality, and as the potteries have more or less difficulty in disposing of the poorer qnality of their wares it always left the market in a very nnsettled condition. We learn that an experienced man, who is thoronghly familiar with the trade, will be appointed by the different mannfacturers as an inspector, and will have the exclnsive say regarding the classification of the ware. He will say whether the ware is A, B or C qnality, and whatever he decides the goods will be sold at the price governing that class. It is believed that this scheme will bring about a more stable condition in the market, and as the demand for this class of ware is continually increasing and is at the present time mnch in excess of the production, it is believed there will be no difficulty in maintaining the prices adopted by the Potters' Association.

Enameled Bathtubs.—The Enameled Bathtub market still shows no change in prices. All of the smaller manufacturers are practically filled with orders to keep them running nntil the end of the year, and these orders have been taken at prices similar to those issued by the combination. The Standard Sanitary Mfg. Company are several months behind in their orders. They are tnrning out Tubs at the rate of 500 per day, and according to reports which are current in the trade, they are receiving orders for 600 Tubs a day.

Tin Cans.—The American Can Company on Jnly 25 advanced their prices as follows: Two-ponnd Cans, from $2 to $2.25; 3-pound, from $2.70 to $3, and gallons, from $6 to $6.70 per 100. Scarcity of Tin Plate, owing to the strike, is likely to cause further advances and perhaps a serions shortage of Cans.

Wire Nails.—Wire Nails from store in New York continue in satisfactory demand for the season. Qnotations are without change, small lots ruling at $2.60 per keg.

Cut Nails.—The demand for small lots of Cnt Nails keeps up in satisfactory volume. From store Cut Nails are quoted at $2.18 to $2.25 per keg, New York.

Wire.—A large demand for Wire continnes, and there is still some delay in getting prompt shipment. The mills, however, are not as far behind in orders as they were some time ago. Prices are firm and unchanged at 2.60 cents for Plain Wire in small lots and 3 cents for Galvanized.

Window Glass.—The demand for Window Glass in the local market is light. Stocks in mannfactnrers' and jobbers' hands are referred to as moderate and no weakness in prices is reported.

White Lead.—There is a fair amount of Lead in Oil going into consumption, notwithstanding the usnal midsummer dullness. Some of the mannfacturing plants have shnt down temporarily, owing to the high price of Linseed Oil and the uncertainty of the future market. No change in prices of White Lead has been made.

Linseed Oil.—The Linseed Oil market remains firm and manufacturers having Oil are inclined to sell only in jobbing lots for immediate and near future deliveries. The demand is moderate and confined to immediate re-

quirements. Raw Oil in small lots is quoted at 83 to 84 cents per gallon, and Boiled Oil is 2 cents per gallon advance on Raw.

Spirits Turpentine.--The market is quiet and prices have declined in sympathy with lower figures at Southern points. Orders are limited in size and confined to small lots, the large consumers not being in the market. Retail quotations are 37½ to 38 cents per gallon.

The Genesis of Slate.

A very great industry in North Wales, says an English contemporary, is the quarrying and preparation of slates. Slates are derived from one of the lowest or oldest series of sedimentary rocks which geologists distinguish in the earth's crust, the Cambrian. Underlying the Cambrian rocks is a still older series of rocks known, for want of a better term, as the Archæan, of the true origin of which there is still some uncertainty, but while the Cambrian rocks have been subjected to many changes, the Archæan rocks have retained their position more distinctly than any of the series of rocks which overlie them. During the cooling of the earth's crust, which has gone on since the Cambrian rocks were deposited on the floor of the ancient ocean, and by the repeated intrusion of masses of granite, trap and other igneous rocks, the Cambrian slate rocks were thrown against the older rocks and subjected to great pressure, which has been continued for a long period of time; the effect of this is now seen in the peculiar construction of the slates; this pressure has, it is thought, brought about the peculiar property of slate, of cleaving into thin sheets or plates. The pressure acting on the particles of the clay originally deposited as a soft plastic mass causes them to lie parallel to one another and thus to produce this cleavage property. Unless the rocks had been subjected to this pressure they would not have broken up into plates. The strata of the slate rocks are found in large folds and convolutions, and the plane of cleavage is found to lie parallel to the axis of these folds. When the slate rocks are examined under the microscope it is seen that their particles lie with their flat surfaces perpendicular to the direction in which the pressure was exerted. The cleavage into thin plates is most readily done soon after the mass of slate has been quarried; the longer it is exposed to the action of the weather the more difficult does it become to split it.

The materials from which the slate rocks are derived are those of common clay, silica and alumina, derived by the weathering of older rocks situated on a continent that existed, in former days, to the northwest, and these materials were carried down by rivers flowing from this continent to an ancient ocean covering the spot where the slates are now found. In the mutations of changes of the earth's crust the continent has sunk and become covered by the present ocean, while the bed of the ancient sea has been raised up into the present dry land. There are some chemical differences between different masses of slate rocks, and it is these differences to which one must look to account for differences of color and for the different wearing qualities of various slates.

TRADE NOTES.

THE AMERICAN METAL HOSE COMPANY of Chicago, Ill., have been incorporated by George H. Ennis, F. G. Frankenburg and C. C. Buell, with a capital stock of $10,000.

R. CLEMENS has been appointed superintendent of the Sad Iron Works at Canal Dover, Ohio.

THE SCRANTON CORUNDUM & EMERY WHEEL COMPANY, Scranton, Pa., are about to occupy new and larger premises at 1311 to 1315 Capouse avenue. They will put in new machinery and be equipped to do a considerably larger business. There has been a change in the officers of the company, who are now as follows: President, Col. Herman Ostraus; secretary, Otto Kacht, and treasurer and manager, J. W. Browning.

THE SUPERIOR MFG. COMPANY of Allegheny, Pa., were granted a charter on Monday, with a capital of $25,000. The concern will manufacture Natural and Artificial Gas Fixtures and will build an addition to their present works for the purpose of taking up other lines of manufacture.

The large foundry of the Abendroth & Root Mfg. Company of New York City, situated in the Greenpoint district of Brooklyn, was almost wholly destroyed by fire on Wednesday morning. The property, which was used by the company for the manufacture of iron pipe, occupied one whole block bounded by West, Oak, Franklin and Noble streets. The origin of the fire is unknown. The loss on stock, building and machinery is placed at about $68,000, which, it is said, is fully covered by insurance.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.

Dietz Junior Lantern

(*COLD BLAST*)

FOR KEROSENE.

This Lantern is called a "Cold Blast" for the reason that it is fed exclusively with cold air, that which comes from above, being taken in through openings between the two rings at the top.

This system of air-supply greatly stimulates combustion with the resultant extra volume and intense whiteness of its light. It is fitted with an entirely new and most effective device for raising and lowering the globe, which also locks the burner in position. It is, in point of fact, a close following to the well-known Dietz Globe Street Lamp, and it will meet the demand of any one seeking an "extra good" Lantern.

This Lantern (and our Blizzard Lantern) are what users have long wanted—Lanterns which a strong wind will not affect, and which can be depended on to stay alight under all circumstances.

It is made with a round top oil pot, and is the handsomest Tubular Lantern made. It is 12 in. high, weighs 26 oz., and holds oil sufficient to burn 13 hours.

For a light weight, convenient Lantern, for use around the house, in the cellar, chicken house or barn, it has no equal.

Made in Tin, Brass, (satin finish) and in Tin with a reflector for use as a Dash or wall Lamp.

FOR SALE BY

ALL LIVE JOBBERS.

If you handle Lanterns send to us for a catalogue and to your jobber for prices.

R. E. DIETZ COMPANY, New York City.

ESTABLISHED 1840.

CARPENTRY AND BUILDING

Series No. 2.

Modern American Dwellings

With Constructive Details.

The Most Elaborate and Complete Volume of Plans Ever Brought Out for the Use of Architects, Builders and Home Seekers.

BY NUMEROUS ARCHITECTS.

A selection of thirty-seven designs of artistic suburban dwellings erected in various sections of the country. at a cost ranging from $2,000 to $5,000, and embracing floor plans, elevations and constructive details showing interior and exterior finish, all drawn to a convenient scale, together with brief extracts from the specifications.

Those who contemplate building a home will find this volume of great value. In connection with each design is given the necessary floor plans, elevations and constructive details as will enable any practical builder to execute the work. The plans are diversified in both the interior arrangement and external appearance, and will afford to persons of various requirements an opportunity to select a home suited to their taste and convenience.

33 Half-Tone Engravings. 127 Full Page Plates of Elevations, Floor Plans and Constructive Details. 40 Pages of Descriptive Text. Size 9 x 13 in. (oblong), Handsomely bound in cloth. PRICE $2.00.

DAVID WILLIAMS COMPANY, Publishers, 232-238 William St., N. Y.

DECISION OF THE UNITED STATES CIRCUIT COURT

SUSTAINING

Lalance & Grosjean Mfg. Co.'s Label.

This Label was originated and is used by us to distinguish our ABSOLUTELY PURE

Agate Nickel-Steel Ware

from other goods, containing either

ARSENIC, LEAD OR ANTIMONY

in the enamel coating.

The Court, limiting its decision to the use of the label only, rules as follows, under date of April, 15, 1901: "Complainants may take a preliminary injunction against the use of the labels, Exhibit G (of the ***National Enameling and Stamping Co.***) or of any similar labels, which by the collocation of size, colors, shape, spacing and lettering may present as close a resemblance to complainants' label Exhibit F (see copy of label adjoining) as do the said labels. Exhibit G (on Granite Ware)."

Notice to the Trade:

The trade is hereby notified that any sales of the so-called "Granite Iron or Steel Ware" under labels like our rectangular labels referred to in above decision, is a direct infringement of our rights as established by the above adjudication and entitles us to claim damages.

Notwithstanding reports to the contrary, we are ***NOT*** members of any "Trust" or "Association," nor have we entered into any "Gentlemen's Agreement" regarding prices on Tinned, Galvanized, Japanned or Enameled Wares, or any other goods we manufacture.

LALANCE & GROSJEAN MFG. CO.,

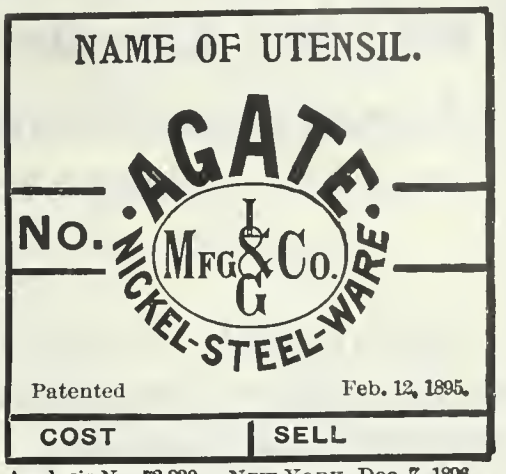
CHICAGO. NEW YORK. BOSTON.

This is a copy of the LABEL, which is printed on BLUE paper and pasted on each piece of GENUINE

AGATE NICKEL-STEEL WARE

as a guarantee of

ABSOLUTE PURITY.



Analysis No. 72,339. NEW YORK, Dec. 7, 1896.

We have made a careful examination of a sample of "Agate Nickel Steel Ware" received from The Lalance & Grosjean Mfg. Co., Nov. 30, 1896.

The enamel coating is homogeneous, of extra thickness, and great purity.

It is *entirely free from arsenic, lead* and *antimony*—metals so often found in enameled goods.

Very respectfully,
STILLWELL & GLADDING,
Chemists to the New York Produce Exchange.

Pierre de P. Ricketts, E.M., Ph.D. John H. Banks, E.M., Ph.D.

Analysis No. 14,180. NEW YORK, May 5, 1897.

LALANCE & GROSJEAN MFG. CO,

GENTLEMEN:—As requested by you, we purchased in the open market a sample of "Agate Nickel Steel Ware" and have made a careful chemical analysis of the enamel covering of the same.

We find this enamel is *absolutely pure* and *free from Arsenic, Antimony, Lead* and *other substances injurious to health.* We can therefore recommend it for all culinary and drinking purposes. Respectfully yours,

RICKETTS & BANKS,
Chemists to the N. Y. Metal Exchange.

Guaranteed Double Coated and Absolutely Pure

Copyrighted.

SPERRY'S HOLLOW-WARE....

Is original in shape and finish. A little better and unlike the rest. Spiders and Griddles particularly nice. Not so high-priced either.

MOST OF US LIKE "FACTS."

It takes ability of a peculiar character and a high regard for truth to always give "facts." "Any fool feels competent to give advice."

Now, these are facts regarding

"Osborn's Star Old Style."

"Star" is a beautifully finished *high grade plate*, and was made especially to fill a demand for a really good plate to sell at a moderate price.

We use the same care and skill in producing this plate as is used in the manufacture of our Celebrated Guaranteed Old Style.

The tinner likes "Star." He likes its appearance, it works well. We have never placed a box of "Star Old Style" in any tin shop that has not brought forth more orders for the same goods. Our sales on this brand alone exceed that of any of the brands we handle, exclusive of Guaranteed Old Style.

The price is very low in view of the very fine quality of the plate.

We shall be very glad to submit you samples and prices upon your request.

A Pleasant Dream.

The beauty of "BERGER'S Classik" METAL CEILINGS is something more than a pleasant dream—it is a pleasant reality.

Berger s "Classik" are the handsomest metal ceilings upon the market and are made in the greatest variety of patterns.

They are correct and harmonious in design and appearance.

Our dies are reproduced from clay models.

Our stamping is sharp, clear and well defined, and brings out the detail in bold relief.

Hence our material combines the ar istic effect of plastic relief with the mechanical excellence of sheet metal.

Berger's "Classik" Metal Ceilings can be applied to either old or new rooms, and over plaster or wood

They make old rooms look like new and impart a handsome and last'ng finish.

It will pay you to know all about them Drop us a line for full particulars.

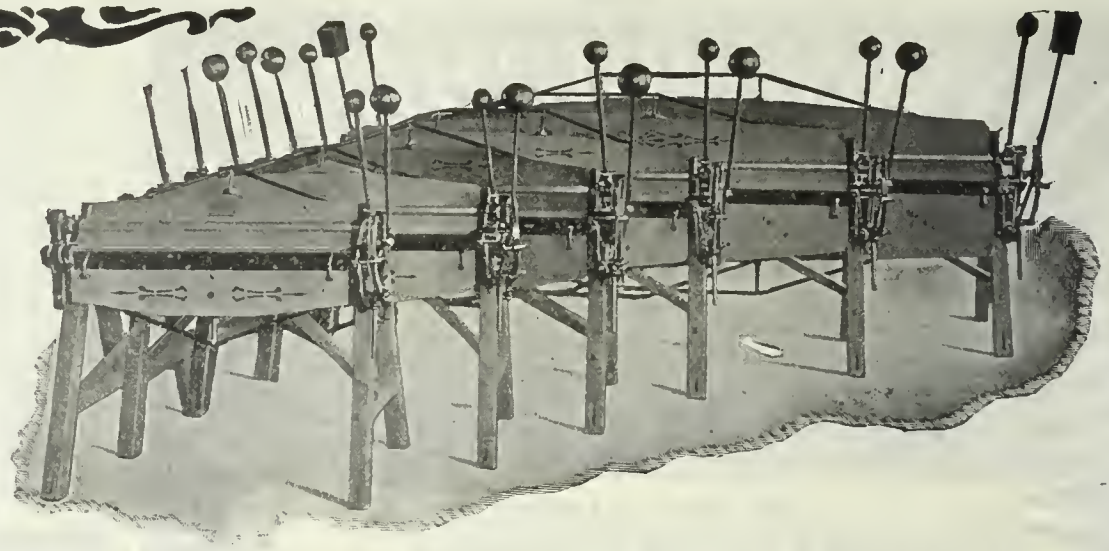
Girgle: "Oh, go to sleep!"—*Harlem Life.*

The Double Truss Cornice Brake.



All the different sizes in which we make this practical machine are herewith illustrated.

This brake costs only half as much as an all-metal brake.

It is made mostly of hard maple.

It is just as good as an iron brake in every respect—much better in some ways. Beside the 50% saved in the first cost our brake will save money in its use.

It is light and can easily be carried from place to place.

By shaping or bending work in the building where it is to be used all the trouble and expense of handling formed-up work is saved.

Write for prices.

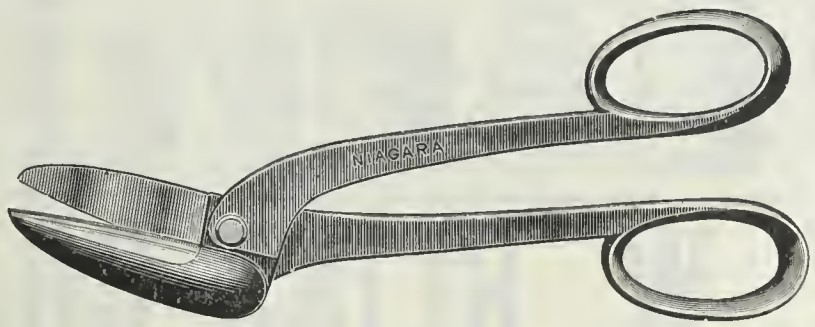
HAND SHEARS FOR SLITTING LONG SHEETS.



Niagara Hand Slitting Shears are distinguished from ordinary Tinners' Shears through the peculiar shape and arrangement of the jaws and handles. The lower jaw is relieved to allow the material to pass by. Both of the handles remain above the work while cutting. A sheet of any length can be cut apart without trouble and injury to the hands of the operator.

Adapted to cutting apart long sheets, cutting corrugated sheets lengthwise, and handy in taking up and repairing metal roofing. Drop forged of best wrought iron and with steel-laid jaws, carefully tempered. Made by

Gray Iron Castings. S. CHENEY & SON, Manlius, N. Y.

One of the most vital points about a steam or hot water boiler is the manner in which the sections are connected. After a great deal of experimental work we have patented a corrugated malleable nipple. It makes a perfectly watertight joint and is far superior to either a push nipple or a screw joint. Additions or repairs can easily be made to the boiler and the joints cannot possibly rust fast. This is one of the many good points about the Paragon Boiler.

JENKINS BROTHERS, New York, Philadelphia, Chicago, Boston.

ROUND OAK— STANDARD of AMERICA

CURTIS GANDY CHI. 1900

You probably have had some experiences with explosions in furnaces

occasioned by putting in too much fuel when fire was low.

A furnace made to resist the worst that could happen along that line and stay gas tight would not be too good, would it?

Well, that is the way the Round Oak is built.

Estate of
P. D. Beckwith, Dowagiac, Mich.

MAKERS OF GOOD GOODS ONLY.

MONARCH CINDERELLA

FOR HARD COAL.

In the Monarch Cinderella will be found one of the most perfect high grade, medium priced, base burning double heaters offered to the trade.

Every modern and desirable improvement is embodied in its construction. We believe the careful buyer will acknowledge that there is not a better stove in its class.

Every point has been studied to make it the best; and for ingenious, effective simplicity in construction it stands without a peer.

Best Workmanship, Best Materials, Silver Nickel.

We would be pleased to send our catalogues.

Pittsburgh Stove & Range Company,

PITTSBURGH, PA.

WESTERN SALES AGENT, W. D Sager, 38 and 40 Michigan St., Chicago, Ill.

The Monitor Base Burner.

High Art Series.

It is without doubt the most powerful heater made and its rich and graceful appearance will attract attention at once The novel construction and distinctive features offer every advantage to the dealer who secures the agency. The diving flue is in front, extending entire width of stove, being what is commonly known as a sheet flue, thus the greatest heat is in the front of the stove where it is most needed. The draft is taken in through the bottom, carrying the heavy foul air which settles near the floor. Grate is of the duplex pattern with outer shaking ring. Two large circulating flues are fitted in rear corners of the stove, affording ample circulation for heating evenly the largest room. Our new catalogue will be out of press on the 17th. Secure the agency at once.

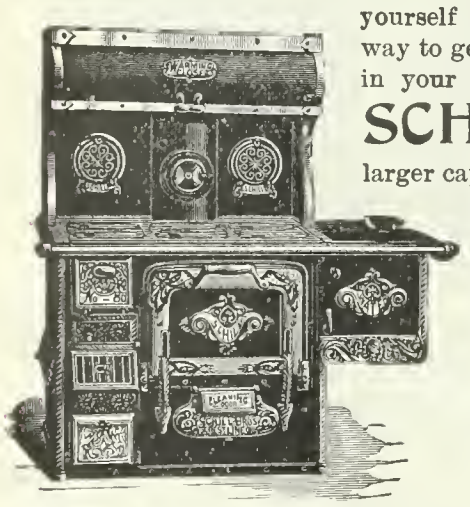
DON'T

handicap yourself in the stern competitive struggle after business by handling an inferior range or furnace. You can't afford to pursue such a course or you will find yourself in the rear division of the procession. The way to get to the front in the furnace and range trade in your town is to handle recognized leaders like

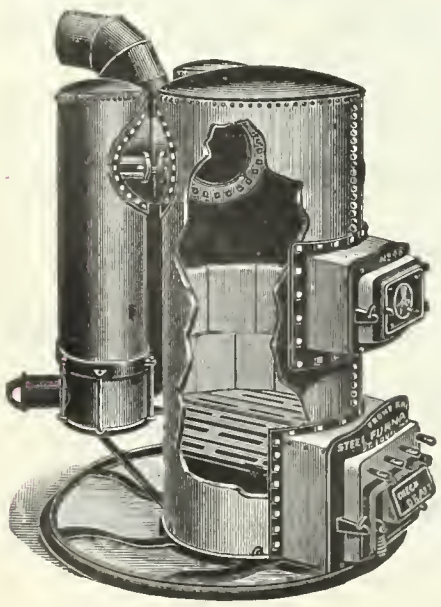


SCHILL FURNACES and **RANGES.** The company making these ranges has a larger capitalization and greater facilities than ever before, and these goods are to be even more widely known in the future than they have been in the past.

Write us for catalogue and discounts.

THE SCHILL BROS. CO.,

CRESTLINE, O.



Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

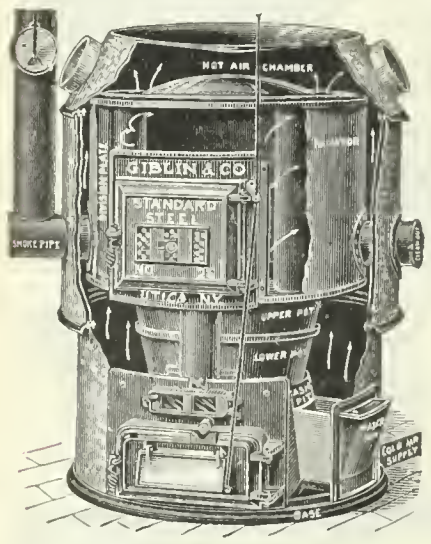
AIR TIGHT HEATERS.

Our line in these comprises everything from the cheapest to the very finest finish possible to produce. Our manufacturing facilities and daily output justify us naming prices below any possible competition. This fact has enabled us to establish Wholesale Agencies in nearly every large city in the United States and makes it possible for us to supply the Dealer "Near His Door," saving time and freight. We also manufacture **Steel Ranges, Steel Cooks, Cast Ranges and Cooks, Hot Blast Coal Heaters, Oaks, Laundry Stoves, Radiators, etc**, all up-to-date goods.

Write us for particulars and we will put you in the way of making some money.

EXCELSIOR STOVE & MFG. CO., - Quincy, Ills.



Mr. Furnace Dealer:

Let us get together personally or by mail and talk the matter over.

You sell furnaces, and in your territory have a lot of people who MIGHT buy furnaces if you could convince them how much they would be benefited by doing so.

Let us tell you how to do this. We can tell you by letter or can have some of our many travelling salesmen call on you personally and tell you. We can show you how you can sell the Standard line of furnaces, please your customers and make a profit. You have sold furnaces and made no profit and failed to please your customers. You sold the WRONG furnace. Now let us show you we have the RIGHT one and things will change. Distance is no obstacle. We will attend to you anywhere in U. S. Write us and let us talk to you. Our catalog is free for asking.

Have you ever kept any record of the time spent figuring jobs you didn't get?

Does the man who gives his heating contract to your competitor show any feeling that your time given to figuring was of any account?

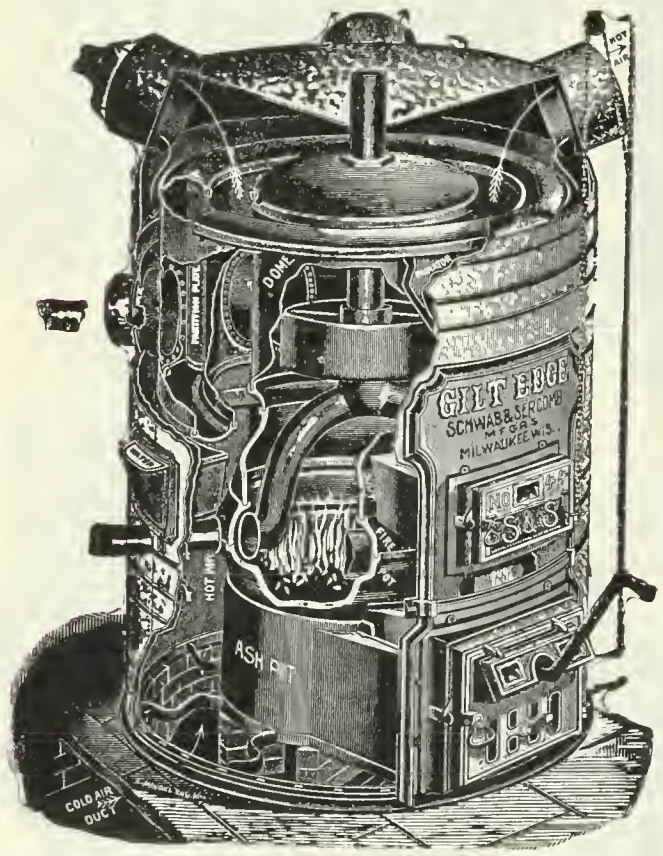
If you honestly believe a "DIGHTON" Furnace will last as long without repairs, heat a given number of cubic feet of space evenly, and do it with less fuel than any other Furnace having the same size fire pot, can't you sell it at a good profit if it don't cost you near as much as others you are now buying?

Every single dealer who has set a number of "DIGHTONS" will speak just as strongly of its merits as we do.

A fair test where there is an opportunity to compare results secured will make you a "DIGHTON" customer.

Many Furnaces that will not do one-half the work that a "DIGHTON" will do, cost you twice the amount we charge you for the "DIGHTON."

DIGHTON FURNACE CO., Taunton, Mass.



UTILIZED radiating surface, that is economy Sectional fire pots from 1 in. to 2 in. thick and other parts in proportion, that is durability. Positive gas-tight joints, that is necessary to health. These, with all other improvements for ease of management, are combined in the Gilt Edge Furnaces. They are made for all kinds of fuel, and are the very best.

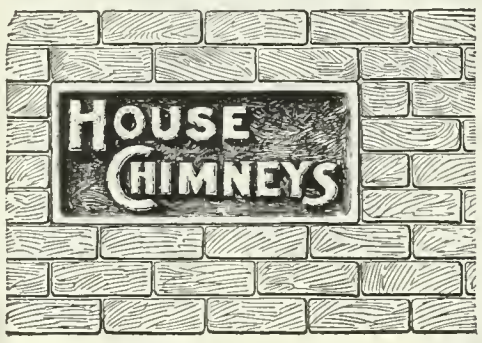
A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title



Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

Page.

POINTS ON CHIMNEYS . 7–32
An illustrated article by J. L. Bixby, Jr, describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.

DEFECTIVE FLUES . . . 33–35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.

HOW TO IMPROVE A WEAK CHIMNEY 36–40

VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS 41–45

CONDENSATION IN STOVE PIPES 46, 47

SMOKE PIPE FOR WOOD FURNACES 48

REMEDYING DOWN DRAFT IN CHIMNEY 49–51

CONNECTED FLUES DESTROY DRAFT 52–55

FAILS TO BAKE ON BOTTOM 56–62

40 good Illustrations help to make the Text clear.

Price, Postpaid 25c.

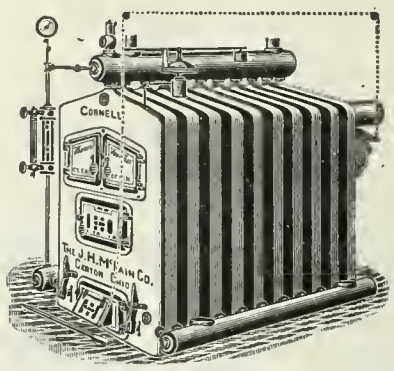
A Burning Question??

Does the amount of fuel your heating apparatus burns interest you? If so our line cannot be overlooked. . . .

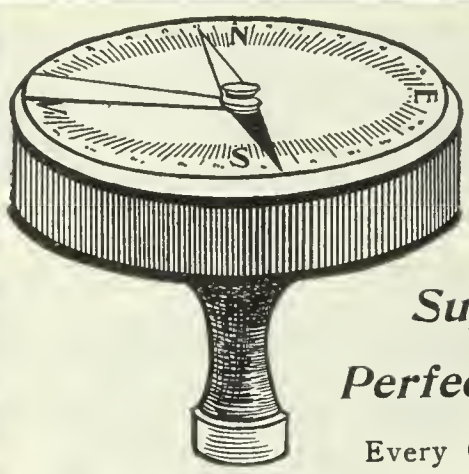
FOR HOT WATER.
Princeton,
Amherst,
Humber,
Yale,
Sandow.



FOR STEAM.
Cornell
Cambridge,
Oxford.

The amount of fuel used, for the efficiency rendered, is a strong point with us. You can burn any kind of coal, wood and gas, and Cost, Comfort and Convenience are told about in Catalogue "C." Don't you want it?

THE J. H. McLAIN COMPANY
Factory and Main Office, CANTON, OHIO.
Branches: NEW YORK. PHILADELPHIA. CHICAGO.



The Cardinal Points with the Champion Steel Ranges are—

Simplicity,
Durability,
Superior Combustion,
Perfect Construction.

Every Champion Range sold makes friends and customers for the seller. People cannot fail to appreciate its fuel saving capacity. Otherwise it is similar and of equal capacity to any other very high grade range.

The Double Flue Hot Blast does it—saves fuel Each dealer should investigate these points. A catalogue that tells all about it for the asking.

CHAMPION STEEL RANGE CO.

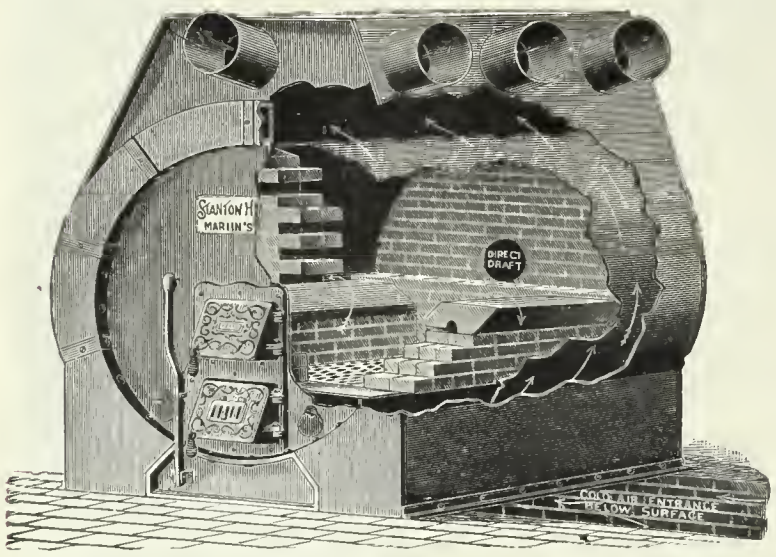
The Stanton Seamless Heater,

PORTABLE CASED.



LOUISVILLE, KY., Apl. 5th, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly

If the Stove Foundries are NOT consolidated, are you fixed to fight the present fierce competition?

Are two concerns in New England, three in Pennsylvania, and three in New York state (one a new beginner) going to monopolize the best trade simply because they are using our patterns for "Cheap to make—Cheap to sell" stoves and heaters?

Troy and Albany might still be making seven-tenths (7-10) of all stoves manufactured in U. S., as they did twenty years ago, had the Foundries listened to our interested (of course), but at the same time sound and wise counsels.

JUST PUBLISHED.

Practical Hints on Joint Wiping,

For Beginners in Plumbing.

SIXTH EDITION, ENLARGED.

With an Appendix Giving a Selection of Practical Letters and Articles Compiled from THE METAL WORKER.

66 Pages. 41 Illustrations. Paper, 25 Cents.

This edition contains besides the two original articles on joint wiping, by experts, a selection of letters and articles on various important phases of the subject.

These include the following:

Joint Wiping on Copper Pipe.
Wipe Joints on Brass and Iron.
Wiping Joints on Tin Pipe.
Wipe Joint on Lead and Iron Pipe.
To Make Tight Joints.
Froze the Pipe to Wipe a Joint.
Wiping Joints Without a Furnace.
The Effect of a Jar on a Hot Wiped Joint.
What Caused the Joint to Break?
Strength of Joints in Lead Pipe
Good Wiping Soider.
Durability of Coarse Soider.
Plumbers' Paste.
Cleaning Soider.
What Breaks Wiped Joints?
Hard Soider to Resist Ammonia.

The first article in the book is written by a practical plumber, and is illustrated from photographs representing the hands and tools when wiping joints in various positions. The second, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that is published.

MERIT WINS.

DID YOU EVER EXAMINE A NO. 10 COIL FIRE POT? If you have not, please do so. You will be surprised to see how good it is. The tank is made of heavy galvanized iron (no tin being used) and the valves are fitted with needle points, which are much better than ground keys, as they give the user better control of the fire and are always tight. All parts are strong and well made. When you buy a fire pot or torch see that it bears our name, which means your money back if it doesn't please. Jobbers supply at factory price.

CLAYTON & LAMBERT MFG. CO.,

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

The Kelsey Warm Air Generator

SEE OUR EXHIBIT AT THE PAN-AMERICAN EXPOSITION.

World's Columbian Exposition, Chicago, 1893, Award, With Medals.

For a new and original, and very efficient form of Warm Air Heater, in which heavy cast iron sections, with corrugated sides, through which is circulated the fresh air, form the fire box and combustion chamber, and are exposed on all sides and throughout their length to the fire and hot gases, thus exposing an exceptionally large surface to the fire.

For the means whereby the warm air may be directed in separate and independent channels, and distributed in such proportions as to insure uniformity of heating in different parts of a building.

Brilliant Enameled Steel Ware

This ware is now manufactured by our factory at Bellaire in the Brown Color only, same having been discontinued in all colors by our Portland, Conn. factory. ☙☙☙☙☙☙☙☙ Particular effort is being made to turn out a highly satisfactory and pleasing article, and all dealers are requested to order a sample lot to be convinced of the merit of this ware.

White and White Enameled Steel Ware

This ware will also be made by our Bellaire Factory only hereafter having been discontinued by the Portland Factory. A large line of hospital goods made in this ware ☙☙☙☙ Recommended where sanitary qualities are essential.

Scarcity of Tin Plates

The fact that practically the entire tin plate manufacturing industry of the country, apart from that controlled by independent firms, is idle and may continue so for some time to come, is a serious matter, and is likely to cause hardship and inconvenience among a very wide circle should the present strike be unduly prolonged. For some months previous to the shutting down of the mills production was barely able to keep pace with the consumptive demand. When the production ceased the mills were found with hardly more than a week or two's supply of plate in stock, and with a considerable volume of orders yet to be filled. Since the consolidation of the greater part of the domestic tin plate industry under the American Tin Plate Company the jobbers have ceased to carry large stocks of plates in their warehouses, finding it more profitable to allow the manufacturer to carry the stock for them and to fill the requirements of their customers directly from the mill. As a consequence the existing restriction of output finds stocks of tin plates in second hands throughout the country very slim. At the present time, after three weeks' suspension of operations at the works, the country is almost bare of certain sizes of plates, and with no prospect of obtaining them within any reasonable time. This condition of things naturally imposes great inconvenience upon a large body of manufacturing consumers, especially the can makers and the smaller manufacturers of tinware and tin goods, who are not accustomed to carrying heavy stocks of material. Moreover, the hardship will extend beyond the manufacturers to other interests. The farmers and growers in many sections will be likely to suffer severely. The season is now beginning when the farmers are getting ready to sell their crops of various kinds to the canners, but if the latter cannot obtain a sufficient supply of cans they will be forced to decline to purchase the perishable produce and the growers may have serious losses forced upon them, owing to their inability to dispose of their ripening crops of vegetables, fruit, &c. The immediate effect of the shutting off of so large a portion of the tin plate output of the country has been that some of the dealers and larger consumers in the East have placed considerable orders for stock abroad. These supplies, however, are not likely to come into the market for some weeks. Moreover, most of the stock thus ordered is understood to have been already bespoken by manufacturing consumers who are obliged to have plates for purposes of filling contracts. Late advices report that prices of Welsh plates have been sharply advanced on the strength of the increased American demand, thus bringing them above the figures quoted for the domestic product, even under the recent advances on this side. The situation in the tin plate trade at the present time is a perplexing one for all interests concerned. Even should the mills resume operations within a very short time, the manufacturers will be unable to fill any new orders within at least three or four months. It is hard to see how an actual tin plate famine can be averted.

Midsummer in the Stove Trade.

In the absence of statistics a correct idea of the condition and amount of business done in the stove trade is always a matter of more or less conjecture. Inquiry among many of the stove houses in New York, however, leads to the conclusion that their order books will probably show that fully as large a volume of business has been done up to the present time as in the same period of any recent year. Those who are most interested find satisfaction in the fact that not only is the percentage of profit substantially better than in some previous years, but also that stove dealers and buyers are well satisfied with their purchases. This, in the vicinity of New York, is in no small degree due to the many meetings that have been held by the manufacturers of stoves. While these meetings have been largely of a deliberative character, without positive action, there is evidence that their influence has been to maintain a remunerative price for a good portion of the stoves marketed. It is probable that many manufacturers are disappointed that more has not been accomplished as a result of their meetings, but what has been done is a decided gain over that accomplished in some previous years under very much the same conditions. That there is evidence of sharp competition is not surprising at this season, yet it is quite generally recognized that the prices on some particular lines of goods show the benefit of the frequent meetings of the manufacturers earlier in the year.

The Opportunity of Cast Iron Heaters.

Another factor which is destined to play an important part in the stove trade of the year is the probability of a shortage of all kinds of sheet iron stoves, whether steel ranges, oaks or the simple sheet iron cylinder stoves used for heating. If the outlook for a scarcity of sheets should be realized it would be, doubtless, a hardship to many. To the retail dealer, however, and to those manufacturers who are carrying a large stock of cast iron heating stoves of older patterns that are not so popular as they were a few years ago, the famine in sheets may be turned to profitable account. So far as the dealer is concerned, if he cannot supply his customers with one kind of heating stove, he must draw their attention to those stoves which he can furnish, and those manufacturers who have been carrying over a stock of the less fashionable though excellent cast iron heating stoves, or who have patterns ready for producing them, will be likely to find a good market for their product. The stove trade may be congratulated on this op-

portunity to turn into ready cash any slow selling stocks that may have been carried in the warehouses and also on the prospect of more work for the foundries. If the shortage in sheets should afford an opportunity to clean out surplus stocks of this kind of cast iron heating goods there can be no question but that it would remove from the heating stove market a factor that might prove a menace to profits. It would be only a question of time when these goods would have to be moved, and if moved at a cut price the influence would surely be to the disadvantage of new goods and cause the latter to be sold at prices lower than would be beneficial to the trade.

Maintain Prices.

The season for the distribution of stoves already ordered is near at hand, and also for buying by those who have delayed from negligence or in order to take advantage of any possible break in the market. This will add to the rush that has never failed to come in the fall of any year. It should encourage those manufacturers who are nervous as to the disposal of their product to stand firmly for the little time that yet remains. If such a policy should be generally observed it would make a material difference in the profits of both the stove manufacturer and the stove dealer for the year 1901. There is nothing so demoralizing to the retail stove dealers as a break in prices at the beginning of the fall trade. It is far better for all concerned to enter the fall campaign with fair prices well maintained, than for the retail trade to entertain a fear that if they do not dispose of stock in hand they are likely to be undersold by competitors who purchase their stock at a later date. The circumstances of the average citizen are easy, there being abundant employment at good wages. There is no occasion to sell cheap goods when a little effort on the part of the salesman will enable the best goods to be readily disposed of at profitable prices.

The trade will observe under Notes on Prices the manner in which the United States Radiator Company are quoting prices so as to serve the convenience of their customers. With the system of list and discount, which is in use in this and in so many lines of goods, it is necessary to do more or less figuring in order to ascertain the net cost of articles purchased, and it is with a view to doing away with or diminishing this labor that quotations are issued in the form shown. The trade will certainly appreciate the regard thus manifested for their convenience and the effort thus made to render it an easy matter to keep in touch with current prices. This disposition compares favorably with the feeling on the part of some jobbers, and even manufacturers, that their interests are served by making it difficult for the trade to keep track of prices and thus buy carefully and judiciously.

In a recent bulletin issued by Carroll D. Wright, United States Commissioner of Labor, some interesting statistics are given covering the labor situation in Great Britain in the year 1899. One remarkable fact developed by these statistics is that of the total changes in the line of increase of wages and reduction of the hours of labor only 3 per cent. were secured through strikes. Of 1,175,576 individuals affected by such changes in the year 1899 only 34,273 had their wages increased in consequence of strikes, and of the whole number affected by changes in wages only 1132 had their wages reduced. The net results of all the changes last year showed an aggregate increase in the wages of working people in Great Britain of over $442,000 per week, the average increase per week for each employee being 37½ cents. Another interesting feature connected with this showing is that 53 per cent. of the employees affected by changes had their wages increased as the result of direct negotiation. In 32 per cent. they were the result of arbitration, mediation or other forms of conciliation, and in 15 per cent. they were the result of the automatic action of sliding scales. The improvement in the condition of the British workmen during the past seven years has been remarkable, wages having steadily increased during that period, while the hours of labor have been cut down in corresponding ratio.

A remarkable scheme for the establishment of a kind of labor Utopia is being agitated among the members of the various labor organizations in and around New York City. The plan contemplates the establishment of an industrial federation, which, according to the prospectus, proposes, when it can dispose of 500,000 shares of stock on the installment plan, to build a city for 500,000 people. The people are to run everything, including banks, factories and all kinds of industries, and generally conduct the business of the city. That the scheme is decidedly visionary may be concluded from the fact that the site on Jamaica Bay, Long Island, selected for the city is at present under water.

The activity in building in Chicago during the first half of this year presents a most gratifying contrast to the showing made during the same period a year ago. In the six months ended June 30, 1901, permits were taken out for the construction of 3145 building improvements, estimated to cost $17,779,965. These figures show a striking improvement over those of the first six months of 1900, when permits were issued for 1274 buildings, estimated to cost $4,536,540. These small totals were, of course, due to the prolonged strike in Chicago, which brought nearly all building operations to a standstill in the earlier half of last year. To what extent operations were suspended may be gathered from the figures for the first half of the preceding year, 1899, when permits were taken out for 2118 buildings, estimated to cost $11,865,200.

Morris Kaplan, a paint dealer of New York City, after a trial by jury, was fined $100 by Justice McLaughlan of Newtown, L. I., last week on the charge of having sold adulterated linseed oil in violation of the State law. The case was brought by the State Agricultural Department and is the first of its kind that has been tried in New York. The department secured 22 samples of oil and found that 13 of the number were adulterated with mineral oil. Ten actions have been brought in consequence by the Attorney-General. Three of the defendants have paid a fine of $100 without trial, and five cases will be tried next month. It is claimed that paint mixed with an adulterated oil will peel off in two or three months, whereas by the use of pure oil the paint should last for several years. The manufacturers of linseed oil claim that the oil is adulterated after it leaves their factories, and they are giving all the assistance possible to the State authorities in prosecuting offenders under the provisions of the law.

The City & Suburban Homes Company of New York, whose operations have been frequently referred to in these columns, filed plans this week for what is claimed to be the largest and finest tenement house in the city of New York. The new building will occupy a block on Avenue A, between Seventy-eighth and Seventy-ninth streets. On the first floor there will be nine stores, and the block will contain something like 200 apartments. Each set of apartments will be a complete private home and will face on the street, the rear fronting on a large central courtyard, so that plenty of light and air will be secured by every tenant. Each apartment will be provided with hot water, steam heat, gas range and washtubs in the kitchen, the aim being to provide every convenience that can be found in the most modern apartment houses. The building is to have four main entrances and eight stairways, and will be of modern fire proof construction.

Business Sketches in America.

Many readers of *The Metal Worker* will remember the visit to the United State of E. W. T. Richmond, managing director of Richmond & Co., Limited, London, England, which concern are interested in the manufacture of gas stoves and gas apparatus generally. Mr. Richmond, while traveling in this country, wrote a series of articles which appeared in the *Journal of Gas Lighting* of London, and which he has issued in a handsomely printed souvenir volume under the title "Business Sketches in America," with the subtitle "Some Methods Worth Emulating." The book is illustrated with fine half-tone engravings, the first showing a group of the London staff of the Richmond Company, taken on the occasion of Mr. Richmond's departure from England on October 20, 1900. The next gives a view of New York City from the steamer as it came up the Hudson River. Several other pictures of New York are followed by *fac-simile* reproductions of letters to the author from President McKinley and Sir Wilfrid Laurier, Premier of the Dominion of Canada. The first article treats of methods adopted by Americans for introducing gas goods to the attention of the general public, and the second is devoted to car lighting and a gas well drilling plant. The third article describes American systems of manufacture, the factory of the National Cash Register Company at Dayton, Ohio, being described and illustrated by a number of attractive views. The tower electric lighting system used in Detroit is also given attention. A fourth article is devoted more particularly to travel, and gives views of the City Hall in Philadelphia, a Boston steamer, &c., ending with a picture of the gas company literature and advertisements collected during Mr. Richmond's tour. The text is interesting and will doubtless give many new ideas to those of the author's friends who are fortunate enough to receive a copy of this dainty publication.

The J. C. Bartlett Company

of Pittsburgh, Pa., have issued from the press their first catalogue, in which they show in attractive style many of their leading lines of specialties in the way of stoves, ranges and heaters. The volume is made up of 64 pages neatly printed on a fine quality of surfaced paper and bound in colored paper covers carrying a design which is largely typographical in character. In the upper outer corner of each page is an ornamental piece consisting of a *fac-simile* of the company's trade-mark. In their introduction to the trade the manufacturers call attention to their casting department, stating that they are prepared to promptly furnish repairs for all stoves and ranges made in that district. They also extend an invitation to members of the trade to visit their warehouse, 632 and 634 Liberty street, Pittsburgh, and also their works at Newton, Pa., where may be seen "one of the best equipped stove plants in Western Pennsylvania."

The leading place in the catalogue is given to the Bartlett range made with removable steel oven and patented in February of the present year. The oven is well ventilated, and the manufacturers claim that there are no points to leak dust or ashes. Being made of steel of even thickness it heats readily, hence less time and fuel are required to do baking and roasting and to keep the oven in quick working order. The fire box is proportioned with a view to securing the most perfect combustion of the fuel, whether it be hard or soft coal or wood. It is broad and long, presenting a large surface of fire under the boiler holes and is said to do its work quickly. The lining of the fire box is anti-clinker, the main point of which is durability. The grate is of the duplex type; the flues are broad and can be cleaned through the flue door, or by taking out the oven, while the latter is fitted with a thermometer, which at all times indicates the temperature. The exterior is richly treated with carved ornamentation in combination with nickel work, and the manufacturers refer to the construction as "the greatest production in the range line of the times."

Following this stove is the Bartlett planished steel Kitchener, a handsome construction fitted with pull out duplex grate, and neverbreak oven rack and adapted for using hard or soft coal or coke. It is made with single and double ovens, the latter style being intended to meet large requirements. Among the heaters prominent attention is given to the Bartlett air tight, a handsome parlor stove with hot blast attachment, made also as a double heater. The Bartlett oak with large reflector ring, which it is claimed forces the heat downward, making it a great floor heater and foot warmer; the Regal Rosemont, an attractive magazine stove for hard coal; the Franklin Argand, a cheap open front parlor stove, and a line of cottage parlor, globe, cannon and laundry stoves are also shown. Several pages are devoted to the Bartlett gas range, constructed of cast iron and fitted with heat indicators, following which mention is made of gas laundry stoves, gas hot plates, the Bartlett portable furnace, miscellaneous goods, &c.

Pennsylvania Gas Furnace.

Schellhammer & Son, 323 Water street, Warren, Pa., who have made a specialty of the construction of hot air furnaces using gas for fuel, make the following claims for their Pennsylvania furnace. The Pennsylvania gas furnace is the original gas furnace and has been on the market for 12 years. There are now over 1100 of these furnaces in successful operation, and they have been used wherever a supply of natural gas is available, as far west as Kansas. A feature of the construction is the use of Wood's refined iron, not a piece of sheet steel being used. This material was selected as it has been found that it is not attacked by rust so readily as other materials. Skilled mechanics are employed in the construction of the furnaces, and the experience is that wherever one furnace is shipped into a new territory pleasing reports come from the dealers of the perfection of its workmanship. In operation no part of the furnace becomes red hot, owing to the construction of the fire chamber, and it is claimed to be practically indestructible. Furnaces that have been used for ten years have been found to be as clean as the day they were first set up. In consequence expense for repairs is conspicuous by its absence.

The spiral flue construction used in the radiator of the Pennsylvania gas furnace is peculiar to it alone and is one of its strongest features of merit. By this arrangement there is a positive circulation of the hot gases, and in traveling over such an extensive fire surface very little heat is allowed to escape to the chimney. Another feature which adds to the efficiency of the furnace is the admission of air to the burner through perforated screens at right angles to the burner proper. The cost of the operation depends entirely upon the price of gas, but it is pointed out that there is a saving of 25 to 50 per cent. for fuel with a Pennsylvania furnace over that consumed in furnaces made for burning coal. A furnace that will burn coal economically and prove durable cannot work as economically as a gas furnace, no matter how good a burner is supplied. Another point is that the efficiency of the Pennsylvania gas furnace is increased from the fact that there is no cast iron surface that is not heated, as in coal furnaees, but every inch of metal surface inside the casing of the Pennsylvania gas furnace is an efficient heating surface.

The construction of the furnace is fully described in a special catalogue issued by the manufacturers, and a circular giving suggestions in regard to furnace heating as applied to the Pennsylvania gas furnace if followed out will tend to make every furnace job undertaken a successful one. The burners used in the furnace are made in two sizes, of 1-inch and 1¼-inch pipe, being from 10 to 40 inches long. These burners are extensively used in coal furnaces, steam and hot water heaters, cooking and heating stoves, and for various other purposes.

The Excelsior Stove Works of Quincy, Ill., have decided to increase their capital stock from $60,000 to $80,000. At the same time their business is growing to such an extent that it has been found necessary to augment their facilities, and to this end they are erecting a new building, 100 x 248 feet in size and six stories in hight.

THE MICHIGAN STOVE COMPANY'S EXHIBIT AT THE BUFFALO EXPOSITION

Among the many interesting displays at the Pan-American Exposition at Buffalo one of more than passing interest to the stove trade of the country is that of the Michigan Stove Company, which occupies a place in Section W in the Manufactures and Liberal Arts Building. It is conspicuously located on a corner and its arrangement is such as to attract a great deal of attention on the part of visitors generally, and of stove men in particular. The illustration which we present herewith gives a very good idea of the exhibit, the engraving being made directly from a photograph.

The display, it will be observed, consists of a number of Art-Garland stoves and ranges, tastefully arranged in a pavilion constructed of wood and staff with ornamentation in white and gold. The inside of the dome is handsomely decorated by means of hand work, and in the extreme top of what might be called the foundation dome are electric lights. In the evening most brilliant effects are produced in the top dome, where is seen the cathedral glass representing the company trade-mark, "Garland Stoves and Ranges." The tops of both domes are painted in a delicate shade of blue.

Exhibit of Michigan Stove Company at Pan-American Exposition.

The background is of canvas, painted with Pompeiian red, and carrying the following inscription: "Largest Makers of Stoves and Ranges in the World. Awarded First Prize at Paris Exposition." The company's trade-mark is painted on both sides, with sufficient ornamentation running around to make the background exceedingly attractive. The name "Weed & Co., Buffalo," on the signs which are hung in the arches in front represents the company's Buffalo agents.

The stoves forming the display are set on a carpet which harmonizes in color with the background, and, with two or three exceptions, they represent the company's regular finish goods. The No. 300 Art-Garland, which is shown in the center of the group on the right, as well as the center base burner on the left, are solid nickeled stoves.

The Regal Oak.

The March-Brownback Stove Company of Pottstown, Pa., have brought out a stove which is referred to as something of a departure in the way of oak constructions. It is of handsome exterior, nickel being judiciously employed to accomplish the desired results, while the top is surmounted by a bronze urn of conventional design. The special feature of the stove is the concealed fire pot, this being accomplished by means of an open work screen. The stove is intended for using hard coal, soft coal or wood; is provided with an Eclipse duplex grate and the company's special slide damper, which is claimed to effectually check the draft and at the same time allow the escape of gas to the chimney. The stove is known as the Regal Oak and is offered in four sizes, the diameter of the fire pot ranging from 10 inches in the smallest to 16 inches in the largest. Attention is called to the new stove by means of a leaflet which is being sent out with the request that it be inserted in the company's supplementary catalogue between pages 22 and 24. This new construction adds one more to the company's already large line of oak stoves, and renders their assortment of especial interest to dealers handling heating goods.

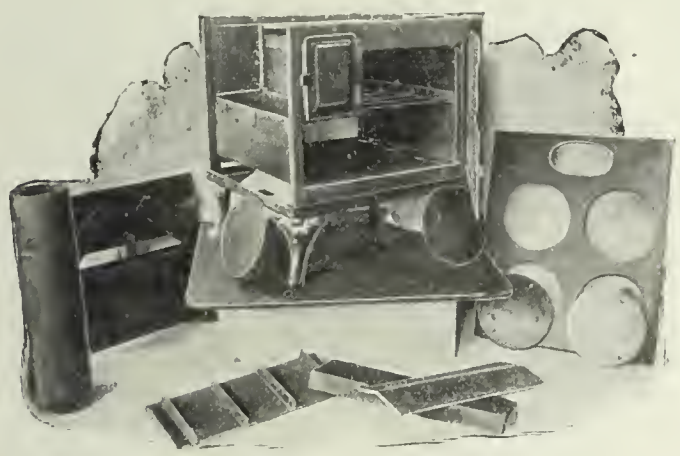
The Keeley Stove Company, Columbia, Pa., have redressed their Columbian Joy Return Flue Base Heater, making it more attractive than ever before. The Stove met with a large and gratifying sale last season, and the manufacturers feel that its new and elaborate dress for the present season will make it the leading seller for dealers to handle. Their Black Diamond Air Tight Stove is a new construction throughout, and embodies the latest improvements. It is made as a single and double heater, and without the magazine and hot air cap and cover it is known as the Black Diamond Circulator. Nickel is used in its ornamentation and exteriorly it presents a very attractive appearance. The company have issued some circulars illustrating these goods, also the Columbian Pilot, which is made in three styles and four sizes.

Norman Steel Range.

The Galusha Stove Company, Rochester, N. Y., point with pride to their Norman steel range, which they have recently brought out, intended for using coal and wood as fuels. It is of handsome exterior, certain parts being nickel plated, which affords a striking contrast with the black surfaces. The company state that they have equipped their steel range plant with the most modern machinery, and every stove body is formed, cut, blanked and punched with mathematical precision and accuracy, thus making every range uniform. For burning coal the Norman is equipped with a large oval fire box, and with duplex or dockash grate, as may be preferred, the linings being extra heavy and made of iron or brick, according to requirements. The duplex grate reversed serves as a grate for burning wood. The oven is of steel and the oven bottom is specially braced with angle irons so as to prevent warping or buckling. The flue, or smoke box, is made of cast iron, which, it is claimed, prevents creosote from rusting it out. The top is made in sections, so as to prevent warping; the broiler door is large, with draft slide, and the reservoir casing is made of cast iron, with a large enameled tank.

Folding Camp Stove.

The stove dealer not infrequently receives inquiries from campers, surveying parties and railroad men for some sort of sheet iron stove that can be readily transported, will not occupy much space, and that has a large cooking capacity and some durability. In response to such a demand M. R. Manhard of Marquette, Mich., made the camp stove shown in the accompanying illustration, about which he gives the following description: The stove can be taken all apart and carried on a man's back. The legs were the only part that were originally designed to be of cast iron, but later it was found desirable to have a cast lining in the stove, in order to enable it to last longer. The pieces shown directly in front of the stove in the picture are the front, back and grate in the fire chamber, and are made of cast iron. The piece standing at the left of the stove, beside the joint of pipe, is the front, and has two draft dampers in it, as shown. The piece to the right of the stove is the top. The stove was made of No. 22 sheet steel and the top of No. 20. The lids have a flat top, but are made in two pieces, and the bottom side is raised to stiffen them. The oven and fire doors are double. The stove is of the exact size of a No. 8 cook and weighs, without the castings, 118 pounds. The weight could have been very much lessened, but to the customer for whom it was designed this was no objection, as the durability that would be derived from the additional weight was desired. The first stove was made for a number of railroad surveyors, who used it all one season, moving it as they required it. This spring they started on a second surveying trip, using the same stove, which has had no repairs or attention, except a new taper piece of pipe. The stove is so constructed that it can be taken apart and set up again in ten minutes. It is hinged wherever it is possible, and the other joints are made with cleats which form a recess for the flange to slide in. When the stove is set up out of doors or in a tent it has given the best of satisfaction, both for baking and general cooking.



Folding Camp Stove.

New Defiance Range.

In the New Defiance No. 8 range the J. L. Mott Iron Works, 84-90 Beekman street, New York, have an up to date combination coal and gas range. In appearance it is a double range, the coal fire chamber being in the center. This chamber is made large in size and provided with a large water back to enable the range not only to have a large cooking capacity, but also to furnish a large quantity of hot water. In connection with the gas range there is a water heater of large capacity made from a coil of ½-inch copper pipe. This is designed to be connected at the top of the range boiler, and it is claimed that hot water can be drawn within five minutes of the time when the burner under the coil is lighted. Both gas and coal ovens are provided, with a bottom slide which draws out as the door is opened so as to bring the food outside the oven, where it can be basted or attended to as may be required. The coal range has six cooking holes on top, while there are four gas cooking holes over the gas oven. Above the range is a gas broiler and a large warming closet. The range is fully described and illustrated in a little circular which the manufacturers are issuing.

Gold Coin Stoves and Ranges.

The thirtieth annual catalogue of Gold Coin stoves and ranges, just issued by the Chicago Stove Works, Blue Island avenue and Twenty-second street, Chicago, is a most creditable publication. The illustrations in this catalogue are specimens of highly artistic engraving, and in every other respect the work has been well done by the book maker. The pages are oblong in shape, thus enabling two good sized illustrations to appear on each page. The catalogue comprises 64 pages in all.

A view of the extensive works of this company forms the prontispiece. The opening pages are devoted to illustrations of steel ranges. The styles shown embrace the Standard Gold Coin and Domestic Gold Coin. These ranges are massive in construction and elegant in design. The bodies are mounted with heavy gauge polished steel plate. All parts coming in direct contact with heat are thoroughly protected with cast iron plates and asbestos. The oven is reinforced by heavy cast iron braces and ventilated on an improved system. The oven door is evenly balanced and when lowered forms a large, smooth shelf. The Gold Coin duplex or antifriction draw center grates are interchangeable at a moment's notice. The tops are furnished with interchangeable key plates, permitting of 7, 8 or 9 inch covers. The reservoirs are extra large, furnished either in bracket pattern or low encased flush top. The high shelf and high closet are particularly spacious, adding much to the appearance of the range. The finish of these ranges is enriched by ornamental nickel panels and a nickel steel edge on the top plate. The Domestic line has a pouch feed and broiler door, which is very desirable for broiling or toasting purposes. These ranges are each furnished in nine sizes. The company also make the Gold Coin hotel steel range, in five sizes, with double ovens, double fire box and 12 cooking holes. All these ranges are intended for coal and wood or can be furnished for wood only.

A line of steel cooking stoves is shown comprising the National and Champion Gold Coin polished steel cooks. The National is designed for coal and wood and the Champion for wood only. These stoves are attractively finished and have large square ovens. They are each furnished in five sizes.

The cast ranges illustrated include a full line, from a fine high grade construction to popular priced ranges for those seeking the cheaper style of goods. These ranges comprise the Grand Gold Coin, Novel Gold Coin, Peerless Gold Coin, Regal Gold Coin, Victor Gold Coin and adapted to all fuels and all purses. The cast cooking stoves shown consist of the Gold Coin, Modern Gold

Coin, Mystic Gold Coin, Gold Medal, Model Gold Coin and Rival Gold Coin.

The leading heater made by this company is the Gold Coin Ventiduct base burner, which is shown in full perspective and in a diagram which enables the ventiduct principle to be thoroughly comprehended. The cold air from the room enters an aperture in the bottom of the stove, passing through two perpendicular tubes in the rear, thus becoming intensely heated, and passing out into the room at the top of the stove. The company's application of this principle is patented. Each stove is a double heater. The stove is elaborately trimmed with nickel, thoroughly ventilated to prevent tarnishing, and is furnished in three sizes. Other ventiduct base burners shown are the Ideal Gold Coin and Marvel Gold Coin. The ventiduct principle has also been applied to the Gold Coin round surface burner, which is furnished in three sizes. All these base burners are designed to use hard coal.

An interesting construction in the heating line is the Gold Coin hot blast ventilator, adapted to the use of hard or soft coal, coke or lignite. This stove has two distinctive features, the first being a ventilating hot air distributing system and the second a combined hot blast and check. The first keeps the air in the room circulating and preserves the fire pot by having cold air rushing around it inside of an open fret work at the front of the stove, from which it passes into the room back of the pipe collar. The second feature consists in taking foul air from the floor and discharging it through hot blast flues into the fire pot and thus increasing combustion. This stove is of handsome design, circular in form and is furnished in two sizes. Other heaters shown are the Gold Coin coal hot blast, the Prize Gold Coin oak, the Star Gold Coin oak, the Security Gold Coin oak, the Gold Coin air tight for soft coal, the Gold Coin coal parlor, the Iron Clad cannon, the Gold Coin globe, the Gold Coin jack globe, the Gold Coin wood hot blast ventilator, the Gold Coin wood parlor, the Gold Coin cottage, the Gem Gold Coin air tight, the Gold Coin Wood air tight, the Gold Coin square parlor, the Gold Medal Todd and the Ajax box, for wood. A line of laundry and tailor stoves is also shown.

Jewel Gas Heaters and Radiators.

A dainty catalogue of pocket size, treating of the Jewel gas heaters and radiators, has just been issued by Geo. M. Clark & Co., 72 to 76 Lake street, Chicago. This catalogue is by no means a small publication in the matter of contents, as it comprises 72 pages and gives details relative to 54 gas heaters and 21 gas radiators. The company thus manufacture a very complete line of gas heating appliances, giving their customers a variety which is probably greater than that afforded by any of their competitors.

The leading place in the catalogue is given to radiators. The Jewel Sanitary gas radiators are first considered. The Sanitary radiators use double tubes, which take cold air from the floor, pass it directly over the burners through the inside tubes and discharge it hot at the top of the radiator into the room, thus preventing any of the products of combustion from mingling with the hot air. The Sanitary radiators use a blue flame and are made in a range of sizes running from 4 to 12 tubes. Another series of radiators, ranging also from 4 to 12 tubes, are made without the inner tubes and are designed to burn an illuminating flame.

The next style of construction shown is styled the Jewel heater, which is a square stove with an open front, containing an aluminum reflector with an asbestos flame deflector. These heaters are made in two series, one for blue flame and the other for illuminating flame. Next comes another style of Jewel heater, also having a square body and open front, containing an aluminum double reflector. These heaters are made in a very wide range of sizes and in a number of different finishes. The other goods shown are cylindrical heaters, some burning with a blue flame and others with an illuminating flame, some having a central flue to discharge hot air at the top and others having an open front containing an illuminating reflector.

Another style of heaters shown has an oblong body mounted on an ornamental cast iron frame, having legs of good size, the whole construction being 23 inches high. This heater has a drilled burner backed by asbestos in the center of the stove, which throws heat down to be deflected by an aluminum reflector beneath, thus causing the flames as mirrored in the reflector to give a novel and pleasing effect. This reflector keeps the floor cool directly under it.

The various heaters made by the concern are furnished either in black finish, bronze finish or aluminum finish. All the castings and sheet steel bodies having the aluminum finish are treated with a liquid preparation, then coated with fine powdered aluminum, which is thoroughly rubbed in and baked in an oven at 300 degrees of heat, producing a beautiful and durable silvery finish that will not tarnish or wear off. The company state that the polished aluminum reflecting surfaces used in their heaters do not tarnish, but remain fresh and bright under all conditions.

The S Stoves and Ranges.

The Sheridan Stove Mfg. Company, Quincy, Ill., have just issued their second annual catalogue, giving a full description of the "S" line of stoves and ranges. This catalogue is handsomely gotten up and comprises 52 pages, which are oblong in shape, thus affording ample room for the display of cuts. The catalogue is bound in seal colored covers bearing a very artistic design in silver lettering. The ranges illustrated include the Select four-hole, for wood, in five sizes; the Select four-hole, for coal, in five sizes; the Select six-hole, for wood, in five sizes, and the Select six-hole, for coal, in five sizes.

The cook stoves embrace both steel and cast construction. The Steel Select cook stove, designed specially for wood, is furnished in four sizes. The Steel Select for coal is made with pouch feed and is also furnished in four sizes. The Select line of cast cooks is furnished in nine sizes for wood and in the same number of sizes for coal. The Surprise cast cook is furnished in seven sizes for wood and six sizes for coal.

The heaters consist of the Serene oak in five sizes, the Smokeless oak in four sizes, the Substitute oak in three sizes, the Supreme hot blast in three sizes, the Sunlet hot blast in three sizes, and sheet steel air tight stoves for wood which are furnished in four sizes. A special feature of the Smokeless oak stove made by this company is in the construction of the feed door, which drops precisely like a range feed door, having flanges on either side wide enough to prevent any coal or dust being spilled on the floor or carpet. Beneath the feed door is a check damper directly over the fire. By opening this an immediate check is put on the hottest fire.

ODD PLATES.

The plant of the Wheeling Gas Stove & Range Company, Reppto & Echols, proprietors, Moundsville, W. Va., was destroyed by fire early last week, but we understand it is the intention of the concern to rebuild at once, so as to be ready for fall trade. The new works will be on a more extensive scale than the old ones, thus giving the company increased manufacturing facilities.

The Danville Stove & Mfg. Company of Danville, Pa., are bringing out under the name "Beaver" a new line of double Heaters having full revertible flue, and will embody the latest features adapted to this class of Stove. The company are also getting ready an improved line of their Beaver Furnaces, which will embody new and unique features. The business of the company during the past year has been very satisfactory and the management looks forward to the future with a great deal of confidence.

The Gurney Foundry Company, Limited, of Toronto, Canada, are sending dealers handling their lines of specialties a large poster lithographed in colors, bound

at top and bottom with metal strips for the purpose of rendering it more durable. There is also an eye for hanging it on the wall. The design represents a kitchen interior with an Imperial Oxford Range in full operation, a smiling cook having just taken from the oven a well roasted turkey. The Imperial Oxford is represented as a substantial construction with handsome exterior, embellished here and there with nickel work.

W. F. CARROTT, who has been Northwestern representative of the Peninsular Stove Company for the past five years, has resigned his position with that company, having formed a connection with the Northwestern Stove Company and the Great Western Stove Repair Company of Minneapolis, Minn. Mr. Carrott is now an officer in these companies and will actively engage in managing their business. The Northwestern Stove Company have made excellent progress in building up a demand for their stoves. They will have three or four representatives on the road to explain the merits of their Select line of stoves and ranges. Mr. Carrott is thoroughly familiar with the details of the stove business, having long been engaged in it, and is well known to the trade in the Northwest.

WILLIAM M. NEWTON, Albany, N. Y., has issued an announcement, under date of July 26, of the fact that he has purchased from Walter E. Ward, the temporary receiver of Newton & Co., the entire Fire Brick and Stove Lining plant formerly owned by this well-known firm. The purchase includes the transfer of the entire business, including molds, patterns, implements, appliances, stock on hand and property of every description necessary for the successful conduct of the Stove Lining and Fire Brick business. Mr. Newton states that he has been owner of the real estate for three years, so that the purchase places him in possession of the entire business, which is now practically freed from all litigation which has hampered it for several years past. Mr. Newton has a wide personal acquaintance among the stove trade of the country, having formerly traveled among them in the interest of Newton & Co.

"GOOD WARM AIR" is the title of a little pamphlet which is being sent out by the Kelsey Furnace Company of Syracuse, N. Y., with a letter which states that 18,000 users of the Kelsey Generator are looked upon as 18,000 friends of the apparatus. This fact may induce the careful reading of four pages especially devoted to the quality and character of air that is enjoyed by those who have their houses heated with the company's system. The little book also contains a card on which are two testimonial letters giving plain statements that would be interesting to the prospective purchaser of a heating apparatus.

THE MICHIGAN STOVE COMPANY are steadily bringing out neat ideas for the use of their customers in advertising Garland Stoves and Ranges. A very effective device of this kind just being distributed is a small price sticker, having a gummed back, which is intended to be placed on all goods going out of the store. This sticker has a well executed reproduction of the Garland trade-mark and a blank space for writing the price of the article to which it is attached. In this way the Stoves handled by the dealer are persistently advertised.

THE ROBINSON FURNACE COMPANY, 107 Lake street, Chicago, enjoyed a large business during July, which showed a heavy increase over the corresponding month of last year. The company more than doubled their business during the first half of the year, and were never so crowded with work as at the present. Included in the business of July was one contract for 36 of their Tubular Furnaces, to be used in a large building operation in the northern part of the city.

THE many friends of W. M. Shaddinger of Chicago will be pleased to learn that he has so far recovered his health that he has concluded to re-enter the Stove trade. Mr. Shaddinger has accepted a position with the Brand Stove Company of Milwaukee, Wis.

JOHN A. SCHULTE & Co., Cincinnati, Ohio, manufacturers of Steel and Cast Ranges, Oak Stoves and Air Tights, are experiencing an excellent demand for their productions for the fall trade, although early in the season. Some improvements and minor changes have been made in their goods, and the company now have a thoroughly modern and up to date line to offer the dealer.

Michigan Retail Hardware Dealers' Association.

The programme for the sixth annual convention of the Michigan Retail Hardware Dealers' Association has just been issued, and an inspection of it shows that arrangements have been made for an exceptionally interesting and attractive meeting. The headquarters of the association will be at the Hotel Cadillac, Detroit, and the convention days are August 14 and 15.

The special feature of the gathering will be the trip to the "Flats" by the steamer "Tashmoo" on the second day. A start will be made at 8.15 a.m., arriving at the Mervue Club at noon, when dinner will be served. After dinner an executive session will be held, when the work of the convention will be completed. After supper the members will again board the "Tashmoo" for the return trip to Detroit. The day will thus be spent in a way that will, it is hoped, prove especially enjoyable to the association.

During the convention papers on the following topics will be read: "The Best Methods of Conducting a Retail Hardware Store," by R. R. Chandler, Coldwater, Mich.; "Credits and Collections," by R. J. Cleland of the Commercial Credit Company, Detroit and Grand Rapids; "Store and Window Dressing and the Best Method of Keeping Stock in Order," by Henry C. Weber, Detroit. An address will also be made on "The National Association and Its Possibilities," by a representative of the National Retail Hardware Dealers' Association.

It is hoped that this will be the best attended meeting in the history of the organization, and present indications, we are advised, bear out this expectation.

With a view to stirring up the active interest of the members of the association the memorandum slip printed herewith has been issued. It is a forcible and eloquent plea and should have a gratifying response:

To Members:

As a paid up member of the Michigan Retail Hardware Dealers' Association in good standing, it is your personal duty to attend this meeting and if possible to bring some neighboring Hardware dealer with you for initiation. The times demand a more perfect unification of interests. Organization is waxing greater every year. There never was a time when the possibilities for practical dollar bringing results were half so great as now. Do your part on this occasion and be a committee of one on membership. Last year many of the dealers did this. It is possible for all to do it in 1901. The Michigan Association will progress and grow no faster than the personal interest of its members.

Let us double our active membership at this meeting.

THE MICHIGAN RETAIL HARDWARE DEALERS' ASSOCIATION.

Gurney Refrigerator Company.

The Gurney Refrigerator Company, Fond du Lac, Wis., manufacturers of the Gurney line of refrigerators, are rebuilding their factory, which was destroyed by fire last April. They are erecting a very substantial brick building, which will be modern in every respect. Fire walls will divide the building into sections, making it almost impossible for fire to spread from one section to another. The company have purchased a very fine equipment of machinery, which is now on the ground ready to be installed. The contract with the builders calls for the building to be completed by August 15. The company therefore expect to begin manufacturing operations very shortly and will then place on the market a new and improved line of refrigerators. The factory will be of such capacity that the company are confident that they will be able to fill orders without delay in the busiest of seasons.

E. D. RHOADES has succeeded Rhoades & Overton in the Hardware, Stove and Sporting Goods business in Rensselaer, Ind.

Samuel D. Martin.

Samuel David Martin, senior member of the firm of Martin & Stover, dealers in stoves, hardware, &c., at Hagerstown, Md., died on Tuesday at the Maryland University Hospital, Baltimore, from peritonitis, following an operation for appendicitis. Mr. Martin was a native of Hagerstown, where he was born 52 years ago. He served throughout the Civil War in the Union Army and participated in a number of the most important engagements, rising to the rank of first lieutenant. At the close of the war he opened a stove and tin store at Williamsport, Pa., where he remained until 1872, when he went to Hagerstown and began the business with which he was connected up to the time of his death. Martin & Stover succeeded in building up one of the finest trades in their line in that section of the country, doing a large and safe business which has withstood all the tests of time and circumstance for over 30 years. The firm are well known to the stove trade, with whom they have an established reputation for integrity and fair dealing. Mr. Martin's removal will make a blank in the circle of his many friends in the trade. The funeral was held on Thursday afternoon at the German Baptist Brethren Church, Hagerstown, and the interment was made in Rose Hill Cemetery. Mr. Martin is survived by a widow and one son.

The Modern Lemon Squeezer.

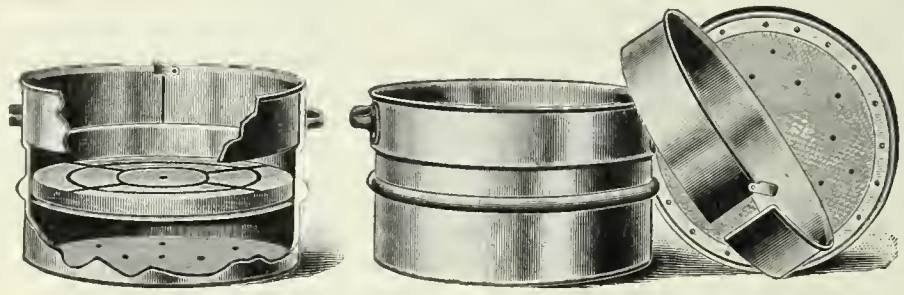
Gilchrist & Means, 43 South Canal street, Chicago, have brought out the lemon squeezer illustrated here-

The Modern Lemon Squeezer.

with. It has roller bearings and is so constructed, it is remarked, that a slight power applied to the handle will give 1200 pounds pressure against the lemon, thus extracting every particle of juice. It is pointed out that its construction is such that it will not splash juice over the operator, that it occupies no valuable space above the counter, and the handle hangs in the position shown in the illustration. All parts coming in contact with the lemon are made of solid polished aluminum, to insure perfect sanitary cleanliness. The other portions of the machine are handsomely nickel plated.

The Sturges Seamless Cheese Hoops.

An illustration is herewith given of the Sturges seamless cheese hoops, manufactured by the Sturges, Cornish & Burn Company, Chicago. The hoops are made from one sheet of steel, without soldered joints or seams, and are then heavily tinned and retinned to make them smooth and serviceable. The manufacturers call attention to the fact that the hoops have no rough edges of metal to rust or corrode, no rivets in the bottom to rust out, no rivets at the top to break or tear the bandage, and no cracks or crevices for the accumulation of mold and dirt. The company now have five sizes ready for the market and other sizes are in course of preparation.



The Sturges Seamless Cheese Hoops.

GALVANIZED WARE IN GREAT BRITAIN.

The special representative of *The Iron Age* in London writes as follows regarding the trade in galvanized utensils in the United Kingdom and the outlook for the introduction of American goods of this class into that country:

The trade in galvanized and japanned hollow ware in this country is confined to comparatively a small number of manufacturers. There is an enormous demand for this class of article, for galvanized buckets, coal scoops, foot tubs, watering cans, oil cans for collieries, turn up skips, seed hoppers, hand bowls, sanitary pans, corn bins, wrought iron kettles and 50 other similar articles. In addition to an exceptionally large home demand, the export trade in these goods is unusually large. At the present moment orders are rolling in from South Africa, Australia and India. The other day I saw an order for wrought iron kettles in four different sizes, 50 gross of each size, for South Africa. The price offered was not satisfactory to the seller, and no business was done. On mentioning the price, however, to a galvanized hollow ware agent, he told me he would be glad of the order at that price, and he saw no reason why it should not prove remunerative. The trade, however, is in a seriously disorganized condition, and there is not much harmony either among the manufacturers themselves on the one hand, or between the manufacturers and their agents upon the other. A gentleman who ought to know assures me that there is no reason why American exporters should not enter the market in these goods, subject, however, to their undertaking to make to English patterns and not to force American patterns here. He says that the steel plates and the galvanizing can be done more cheaply in America in large quantities, while freightage should not prove a serious difficulty, inasmuch as "nesting" can be almost universally resorted to. The especial changes from the American to the English patterns which are required would be, 1, iron rod handles instead of wire; 2, better riveting, and, 3, a circular base instead of the flat bottom so common in America. An agency was recently offered to a progressive agent in London by a Staffordshire manufacturer on the basis of 1½ per cent. It was refused as not being worth the trouble on that basis, and, after some haggling, 2½ per cent. was agreed upon. If American manufacturers can bring their prices down to 5 per cent. under English prices, and give their agents in London or Manchester 5 per cent., there is every reason to suppose that a good

home and export trade can be done. Freight rates from New York to South Africa are at the present moment more favorable than from Southampton or Hamburg. Although American hollow ware is, of course, in a very small way known in this market, American manufacturers as a body do not seem as yet to have seriously tackled the trade over here. I send herewith a few illustrations of the type of galvanized buckets which are favored in this market.

Fig. 1 is a patent galvanized bucket, with seamed sides, sold in 10, 11, 12, 13 and 14 inch sizes. If the sides are riveted the price is raised 1 shilling. Fig. 2 is a very strong contractors' galvanized bucket, with welded bar hoop top and bottom, stayed front and back. It is made in 11, 12, 13 and 14 inch sizes. Fig. 3 is a type of English galvanized round foot tub, made in ten different sizes and three different qualities, the cheapest, medium and strong, hoop or strapping being charged extra. Fig. 4 represents a galvanized deep turn up skip,

Fig. 1.—Galvanized Bucket, Seamed Sides.

Fig. 2.—Contractors' Galvanized Bucket.

Fig. 3.—Galvanized Foot Tub.

Fig. 4.—Galvanized Turn Up Skip.

GALVANIZED WARE IN GREAT BRITAIN.

with strapped bottom and bound under wire, the handles being 4 inches below or level with the rim. Made in three sizes and two qualities. These are representative patterns, and indicate the style of thing required on the British market. I shall be happy to supply any inquirer with prices and discounts upon application to the editor.

Domestic Garbage Burner.

The Domestic Garbage Burner Company of Salt Lake City, Utah, are distributing a 16-page pamphlet under the title "Behold! a Problem Solved," showing, in connection with a modern steel range, their domestic garbage burner, which consists of a sheet iron box arranged to be attached to the smoke outlet of ranges. In operation all refuse of the kitchen is placed in the receptacle, and, after being dried or carbonized by the hot gases passing through, it can be readily burned without an offensive odor. The construction is such that it does not interfere with the draft. The catalogue also shows the Harris Model hot air radiator, designed for use in connection with the smoke pipe of stoves, furnaces and boilers. The radiator, by its peculiar construction, presents a large amount of surface to the hot gases passing through it, and this heat is in turn transmitted to the air which passes over the heated surfaces. It is claimed that additional heating power is derived from the fuel, and also that an economy is effected by keeping the draft under better control.

F. H. Hill, who recently sold his interest in and severed his connection with the Hill, Whitney & Wood Company of Waltham, Mass., has opened an office and wareroom at 90 Canal street, Boston, under the name of F. H. Hill & Co., and will continue the manufacture of the Hill Champion Steam Cooker, the H-W Double Roast and Bake Pan, and the Victor Fry Pans and Broilers. He also will act as manufacturers' agent for the Gilray Curtain Stretcher Company, the Grass Mfg. Company and William Shimer, Son & Co.

Best-of-All Street Rubbish Cans.

The Central Stamping Company, 25 Cliff street, New York, are manufacturing under the name Best-of-All a new line of patent municipal rubbish cans, of which illustrations are presented herewith. These cans, as shown in Fig. 1, are made of strong sheet steel, thor-

Best-of-All Street Rubbish Can.—Fig. 1.—General View.

oughly galvanized after being made, to prevent rust. They are built with heavy lugs, upon which the bottoms rest when nested. This patented method of nesting prevents the cans from binding and brings the weight where it belongs, at the bottom, at which point they are reinforced by an iron rim, as shown in Fig. 2. By the use of these patented lugs the handles and rivets are released from strain and the can is saved from the dilapidated appearance so often shown by receptacles of this description. A special feature is the riveting of the lugs so as to prevent the sections from spreading under heavy use. The handles are similarly riveted, thus bind-

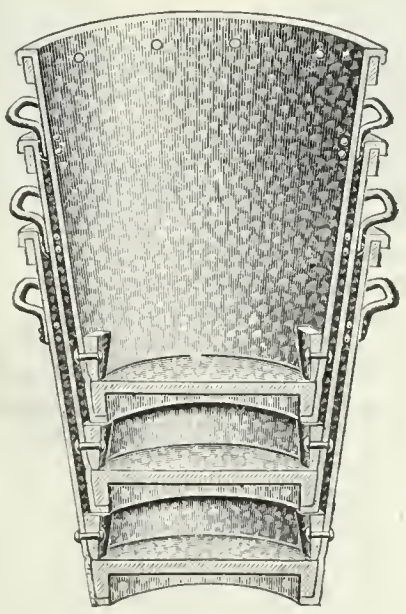


Fig. 2.—Cans Nested.

ing the parts firmly. The Best-of-All rubbish can has been tested in Greater New York and adopted as standard by the Street Cleaning Commission. It is also finding its way into use in many of the cities and towns that employ improved methods of sanitation.

Request for Catalogues and Quotations.

Peden & Co., Houston, Texas, who are large dealers in roofing materials, pipe and fittings, telegraph and telephone supplies, tinners' supplies, &c., are adding to their stock a full line of steam fitters' tools, supplies, packing, belting, &c., and will be pleased to receive from manufacturers of these goods catalogues, quotations, &c.

Stove and Hardware Dealers.

SAGINAW MFG. COMPANY, Saginaw, Mich., have added to their extensive line of Washboards an improved Glass Washboard, for which they are now about ready to fill orders. The rubbing surface being of glass, it is remarked that there is no chance for clothes to catch on the Board and be torn, and with proper care the Board should last for years.

THE ADAMS & ELTING COMPANY, Department 10, Chicago, have issued an artistically designed folder relating to their new Ad-El-Ite Tinted Enamels. These enamels are stated to dry hard in 12 or 16 hours and to produce a smooth, hard, lustrous and durable surface not affected by moisture or heat. They are applicable to walls, ceilings, furniture, picture frames, iron beds, toys, radiators and in fact any surface of stone, iron or interior finish. The folder reproduces the 18 tints in which these Enamels are made.

GEO. BRANDVOLD has disposed of his Hardware and Stove business in Rembrandt, Iowa, to Brandvold & Wellmerling, who continue at the old stand.

HOLLAND LUMBER & HARDWARE COMPANY, with stores at Gebo and Joliet, Mont., were damaged by fire at the former place a short time since. The loss was $13,800, on which an insurance of $12,650 was collected. The company are wholesale and retail dealers in Hardware, Shelf and Heavy; Stoves and Tinware, Farm Implements, Sporting Goods, &c.

CHAS. A. FOWLER has purchased the retail Hardware, Stove and Tinware business of L. F. Holloway, De Witt, Neb.

AT the picnic of the Chicago Retail Hardware Association, to which reference was made in our last issue, some merriment was occasioned by a conspicuous sign which some oue had placed on the rough counter of the principal refreshment booth. This sign informed everybody that the fixtures had *not* been furnished by the John D. Warren Mfg. Company of that city. Mr. Warren, who was present at the outing, was blissfully ignorant for a long time of the notoriety thus accorded to his concern.

MANN HARDWARE COMPANY, wholesale merchants, Greenwood, Miss., have increased their capital stock from $30,000 to $40,000, and are putting up a $10,000 storehouse. Their line includes Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting and Athletie Goods, &c.

THE Hardware stock of the Geo. W. Peck Company's store at Dansville, N. Y., was completely destroyed by fire on the morning of the 26th ult. They will immediately resume business in another building, and request the trade to send them catalogues and quotations on Hardware, Agricultural Implements and Plumbiug, Heating and Sheet Metal Goods of all kinds.

C. R. GUINN has lately entered the business field iu Violet, O. T. Mr. Guiun is carrying a stock consisting of Shelf and Heavy Hardware, Stoves, Tinware and Agricultural Implements.

SCHULTZ'S STOVE & HARDWARE COMPANY have been incorporated at San Antonio, Texas, with a capital stock of $30,000, by Max Schultz, Herman I. Schultz and William Schultz, to conduct a business in Stoves and Hardware.

FREDERICK MATTHES, who was in the plumbiug, heating, roofing and tinsmithing business at Lyons, N. Y., dled on July 25 as the result of au lnjury sustained some weeks ago in a fall from a scaffold on a building where he was workiug. Mr. Matthes enjoyed an enviable reputation in his town, and had served two terms on the board of Village Trustees. He is survived by a widow and six children.

United States Consul Mahin of Reichenberg reports to the State Department that the price of petroleum, whlch had materially advanced last year, is now steadlly declinlng in that part of the world. In the Russian oil district the deeliue is very marked, amounting to fully 50 per cent. at Baku since January 1. Thls is due to an increased production, amounting to about 25 per cent., as compared with the early months of 1900, and to a large accumulation of reserved stock. The reserve at Baku is now said to be about 7,222,000,000 pounds. In Russian petroleum circles the blame for these enormous accumulations is laid to the inadequate transportation facilities offered by the Government rallways.

Cleveland Prism Glass.

Cleveland Window Glass Company, Cleveland, Ohlo, are manufacturing the Cleveland prism glass for lighting up lnteriors wlth natural light, by means of prisms so arranged that beams of sunlight are bent and carried into otherwlse comparatlvely dark rooms, on a plan wlth the floor and ceiling, more particularly street floors,

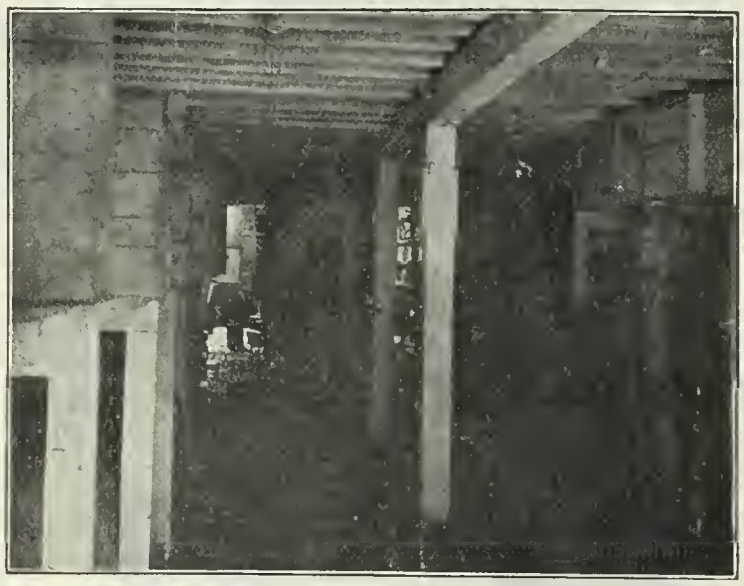

Fig. 1.—A Cellar without Prism Glass.

celiars and kindred places. although they are also used much higher up. The glass prisms are made in 4-lnch squares, which are set in either zlnc or copper frame work, according to the cost, the slze of which depends on the dimensions of the sash to be covered. They can be furnished for sash or in a separate frame to go outslde the sash. Applied to old work the frames are seeured to the outside of the window, usually covering the

Fig. 2.—Same Cellar with Five Feet of Prism Glass.

upper half of it, the lower portion remaining plain glass to see through. The frame work of prisms ls sometlmes vertical and often at an angle wlth the elevatlon of the building, according to the requirements of the sltuation. Fig. 1 illustrates a cellar interior 85 feet long, as it was, with only one window at the end, Fig. 2 being designed to show the great lucrease of natural llght produced by the installation of the prisms.

The Amalgamated Associatlon strike is affecting the railroads materially. One of the principal roads runnlng from Chieago to the East ls reported to have had contracts canceled for more than 1000 carloads of freight as a direct result of the strike.

WILMINGTON PLUMBING RULES.

The authorities of Wilmington, Del., have recently put in force a new set of plumbing rules, consisting of 47 sections. The new rules, which give considerable authority to the plumbing inspector, require that no one shall be eligible for this office without having had five years' practical experience and having been a continuous resident of the city for a period of five years previous to his appointment. It is necessary that he should take an oath that he will faithfully enforce the rules and give a bond of $2000. His salary will be $1500 a year. Those who desire to engage in plumbing must prove their competency, when a license will be granted on the payment of a fee of $5. Applicants are required to file with the secretary of the Street and Sewer Department an approved bond in the sum of $1000. They must also deposit with the board the sum of $25 to protect the department from negligence or imperfect workmanship in opening or closing streets for sewer and water connections. It is required that the words "Licensed Plumber," in letters not less than 3 inches square, shall be displayed conspicuously in front of their places of business. The regulations also require that plans must be submitted to the plumbing inspector and the department after the detailed drawings showing the arrangement of the work and the method of doing it are completed.

One section of the regulations provides that no master plumber shall allow his name to be used by any other person or party, directly or indirectly, for the purpose of obtaining a permit, or doing any work under his license, nor shall he sublet any part of his work to any other master plumber without first obtaining a special permit from the plumbing inspector. The penalty for the violation of the provision is the revocation of the license or a fine of $25, or both, at the discretion of the board. Another of the regulations provides that persons from other places may do plumbing in Wilmington by securing a special permit from the department for any one particular job, upon satisfying the inspector that the applicant is a legitimate master plumber engaged in the business and having a license from the officials of his own town. In case more than one permit is required the applicant must comply with the conditions presented in section 3 of the regulations, which is that they must take out a regular license to do plumbing work.

LEAD BURNING.

When lead burning is spoken of among lead working mechanics the opinion is often expressed that the art of lead burning is of very little use, owing to the infrequency with which it is in demand. There are several old established fields in which lead burning is needed, and within the past few years a new one has been added to its sphere. Wherever there is any considerable manufacturing done in which brass and copper goods or metal goods of similar character are produced lead lined tanks are important factors in the equipment of a plant. This also holds good in many towns where dress fabrics are produced. Also, wherever there is a chemical plant manufacturing different chemicals or a laboratory for reducing ores and smelting, lead lined vats and tanks are indispensable. The only substantial method of joiuing the different sheets which line such tanks is the lead burning process, which consists of melting the two edges of the different sheets so that they fuse together in one mass.

Of late years the lead burner is not infrequently called in to run the waste pipes from chemical laboratories or in jewelry manufacturing shops, where strong acids cannot be discharged into the usual cast iron drain pipe, owing to their destructive effects. The drainage system, under such conditions, naturally must consist of lead, and the only way to connect the different pieces of lead pipe is by lead burning. In such cases, owing to the places in which the lead pipe must run, the skill of the lead burner is often taxed to make satisfactory connections.

The use of storage batteries for electrical purposes within a few years has also very greatly extended the field of the lead burner. It is only necessary to visit some of the large plants to find an almost endless number of lead lined tanks in which the seams are joined by the lead burning process. In places where these batteries are recharged, if the acidulated water was poured out and allowed to run into the ordinary drain without dilution, it would mean an early destruction of the drain. In some cases the floors of such buildings are covered with heavy sheet lead with the seams burned together, and the floor made to pitch to a point where the lead drain pipe carries away the solution. The discharge is regulated by a workman, who allows the water to flow in, diluting the solutions to such an extent that they become harmless. In some instances the floors of such buildings are covered with concrete and drain to a lead collector, where the dilution is effected.

An investigation of the many cases in which lead is used for holding acids will lead to the conclusion that lead burning, which seemed to be almost a lost art and unnecessary in the trade but a few years ago, is now gaining a new lease of life and bids fair to be in greater demand than ever before.

The Royal 1900 Air Valve.

In the accompanying illustration we present a general and a sectional view of a new automatic air valve that is being put on the market by the Pierce, Butler &

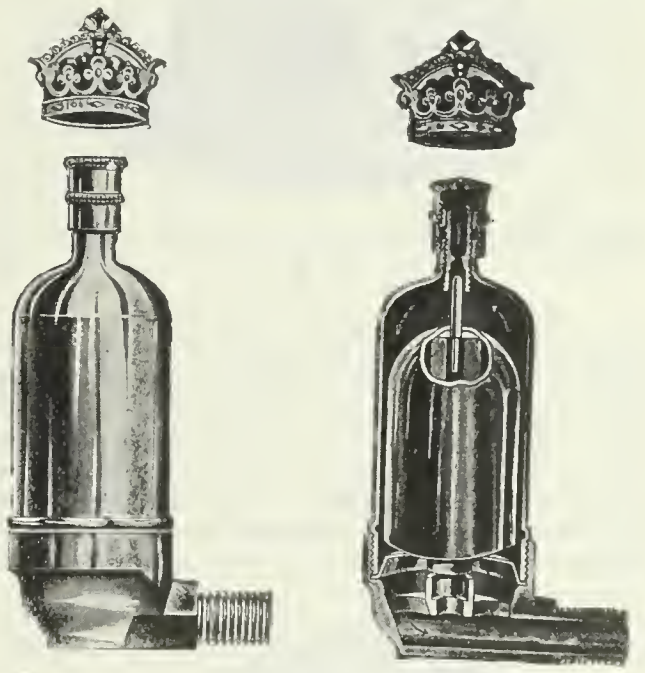

Fig. 1.—General View. *Fig. 2.—Sectional View.*

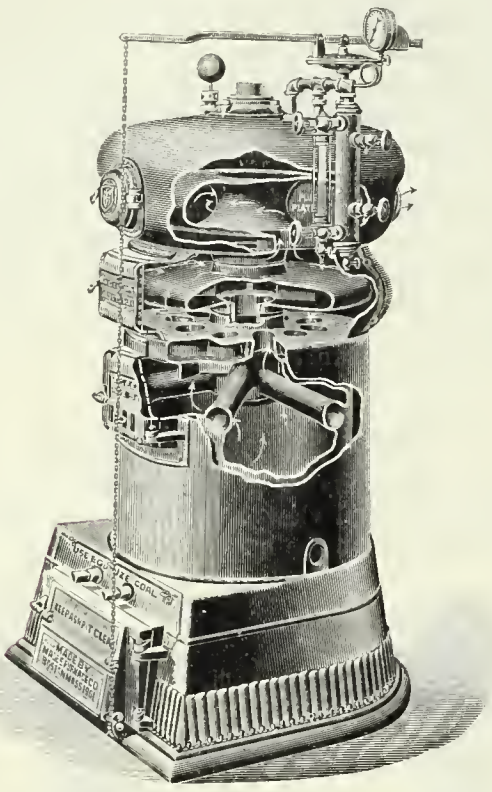
The Royal 1900 Air Valve.

Pierce Mfg. Company of Syracuse, N. Y., and 46 East Twentieth street, New York City. This automatic air valve has a ball joint siphon float so constructed as to allow the escape of cold air, but which will close upon escape of water by floatation, and of steam by expansion. The patent ball joint is said to make a perfectly tight joint, which prevents leakage. A deflector is provided which prevents excessive air pressure from raising the float and prematurely closing the valve. In this new and improved construction a siphon is formed in the base, which allows the water of condensation to leave the valve quickly and return to the radiator the instant the valve closes. This enables the valve to free a large radiator from air much quicker than with the best makes of the ordinary air valve. The expansion rod is of a composition which is said to be very sensitive, operating quickly and which has indefinite lasting qualities. The valves are made of the very best material and best workmanship, so that they are fully guaranteed. A pamphlet devoted to these valves has recently been completed and can be secured on application.

The Supervising Architect at Washington, D. C., will receive bids until August 22 for installing a new boiler plant in the United States Marine Hospital at Cleveland, Ohio.

The Magee 019-190 Boilers.

Efficiency and economy in operation are prominent features in the new series of 019-190 Magee boilers, which the Magee Furnace Company, Boston, Mass., are presenting as one of their Twentieth Century lines of heating apparatus. These boilers are designed for both steam and hot water heating. In Fig. 1 a sectional view of the steam heater is shown, from which the construction and operation can be readily seen. Fig. 2 shows the fire pot section, a special form of coustruction designed so that the heating surface may be exposed to the direct rays of the fire, and also to provide for an internal circulation which will maintain a steady water line when the boiler is used for steam heating. It will also be noted that openings are provided for the hot gases rising from the combustion chamber to pass to the flues formed by the outer casings and the upper sections. The arrows show the movement of the gases, from which it will be readily seen that before escaping to the chimney their principal heat is utilized for heating water or making steam.



The Magee 019-190 Boilers.—Fig. 1.—Sectional View of Steam Boiler.

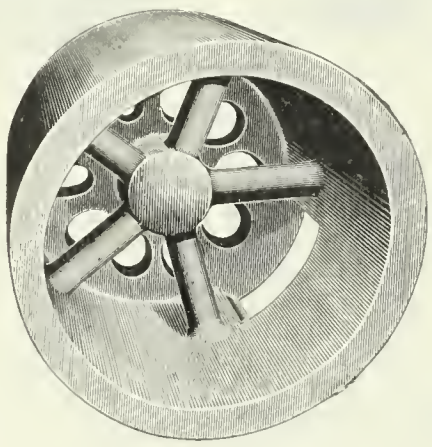


Fig. 2.—View of Fire Pot Section.

Not less important than the efficiency and economy of operation is the facility with which these heaters may be set up by the steam fitter. The top section in this series, when used for steam, is made with a larger chamber at the top to serve as a steam dome. This chamber, when the apparatus is used for hot water, is not necessarily so large and the heater is somewhat reduced in hight. Another interesting feature is the provision of a substantial base supporting the upper parts of the heater. This base is so arranged that the entire labor saving grate may be removed to the front of the ash pit by the simple removal of one plate. The heaters are made in five sizes, having grates 19, 22, 25, 28 and 31 inches in diameter, and the heaters vary in total hight from 57 to 63 inches. They are rated to carry 600, 825, 1100, 1400 and 1800 square feet of direct hot water radiation when the piping is calculated as heating surface. The company have just issued a new 12-page pamphlet printed in two colors, containing a full explanation, including tables of dimensions, of this new line of goods.

The Page Boiler Catalogue.

A new catalogue has been issued by the W. H. Page Boiler Company, consisting of 36 pages bound in a dark green cover, bearing a design in silver bronze in which the name and address of the company are given. The introduction states that the boilers made by the house have been introduced in many parts of the United States, and the increasing demand for them is the best evidence that they have satisfied the purchasers. The meritorious features of the boilers are made the subject of a special page. The first 11 pages are devoted to the Volunteer steam and hot water boilers, which are of the round horizontal sectional type, made in 14 different sizes, with grates from 15 to 42 inches in diameter. The All Right steam and hot water boilers occupy five pages and are made for brick setting, the sections being of horizontal type. These boilers are made in four sizes, having 18, 21, 25 and 30 inch grates. The Monarch is a new vertical sectional boiler of the return flue type. The sections are made with an upper and lower crown sheet to increase the fire surface, and are connected by means of screw nipples. The sections rest on a substantial base, which also supports a grate of the labor saving type, arranged so that any section can be readily removed. These boilers are made in six different sizes, having grates 38 inches wide. The Page safety sectional boiler is well known to the trade and is designed for brick setting. It is made in eight different sizes, having grates 48 inches wide. The Hornet steam and hot water boilers, made in three sizes, are rectangular in shape and composed of but three castings—base, fire pot and dome section—the castings being so made as to secure an indirect draft. The catalogue contains a complete telegraphic code.

New York City Notes.

Manhattan branch will give its annual outing and Rhode Island clambake at the Crocheron Hotel, Bayside, L. I., Wednesday, August 28. The committee, composed of T. J. Tuomey, John Renehan, T. F. Gaynor, J. W. Cooney, I. O. Shumway, J. W. O'Brien and E. J. Brady, promises to make this outing "the finest that ever happened." Tickets are to be obtained of John Renehan, 163 East Thirty-fifth street. There will be games of all descriptions, and boating, fishing and swimming matches for valuable prizes.

* * *

Trade still continues brisk in most shops, the only trouble being to get enough material as wanted.

* * *

Among the busy plumbers are J. H. Steinmetz, who has an apartment house at 142-146 East Twenty-seventh street; C. E. Innes, with an apartment at Seventy-eighth street and Broadway, and Wm. Messer, with a row of tenements at Baxter and Bayard streets. Jos. Bloch has five flats on 111th street, between Fifth and Madison avennes; Rosenbluth & Dowling have an apartment at Madison avenue and Ninety-ninth street, and Callan & Oliver a row of flats on 140th street, between Lenox and Seventh avenues.

* * *

The labor troubles of the journeymen have again extended to Brooklyn, where all the other mechanics on the job have left the new building of the naval branch of the Y. M. C. A., donated by Miss Helen Gould, and

where the plumbing is being done by Chas. Tucker of Manhattan, who employs Amalgamated men. The complaint was made by Local Union No. 1 of the United Association.

* * *

The Executive Committee of the Greater New York Association will hold its August meeting in the Mohawk Club rooms, Far Rockaway, L. I., on Monday, August 5, at 4 p.m. No doubt they will be well taken care of by the Rockaway members.

Heating and Plumbing Notes.

THE CENTRAL FOUNDRY COMPANY have decided to dismantle their Soil Pipe plant at Gadsden, Ala., and remove the machinery to their Bessemer, Ala., plant. This will make the company's plant at Bessemer the largest Soil Pipe establishment in the South.

S. B. CHURCH, Seymour, Conn., is erecting a 50,000-gallon water tank for the Smith & Griggs Mfg. Company, Waterbury, Conn., for fire protection. The tank will be supported on a 12-post steel frame, 60 feet high. Mr. Church is making a specialty of Gas and Gasoline Engines for machine shops and small manufacturing plants, and carries in stock and can furnish promptly any size Engine up to 60 horse-power.

THE HOPSON & CHAPIN MFG. COMPANY, New London, Conn., will furnish the heating apparatus for the Winthrop School in that town.

THE striking plumbers at Marion, Ind., being unable to adjust their trouble, have opened a plumbing shop in that city.

REUBEN PURSER died suddenly at his home in Windsor, Canada, July 22, at the age of 75 years. He conducted a plumbing and Hardware business in Windsor for 35 years and retired about two years since.

JOSEPH B. FORD, who has been in the plumbing business at Hinsdale, Mass., for a number of years, has closed out his stock and will retire from active business.

A FIRE occurred in the plumbing shop of Lundwall & Rich, at Bozeman, Mont., doing damage to the extent of $800.

THE journeymen plumbers of Fort Worth, Texas, have withdrawn from the Building Trades Council.

COLWELL LEAD COMPANY, 63 Centre street, New York, have favored us with a miniature specimen of their Cuckoo Embossed Wash Down Closet Bowl, with seat attachment, which the company have had specially modeled and which they are sending out to their numerous customers. The model, which can be used as a paper weight, a pin holder or a match holder, is a very appropriate article for a plumber's desk. It is an exact copy of the Cuckoo, which is the most popular of the company's Bird series of Wash Down Sanitary Closets.

THE School Board of Oskaloosa, Iowa, will receive bids until August 6 for a steam heating plant for the First Ward School Building in that town.

G. W. GERWIG, secretary of the School Board of Allegheny, Pa., will receive bids for a heating plant for the Allegheny High School and annex.

GEORGE STOTHART, secretary of the Board of School Trustees of Chatham, New Brunswick, will receive bids until August 10 for a hot water heating plant and plumbing for a new school building in that city.

A NEW board for the examination of plumbers has been organized in Montreal, Canada, composed of Commissioner of Sanitary Engineering Doré, Building Inspector Chausse, and J. W. Hughes, who is well known to the plumbing trade both of the United States and Canada.

THE KELLY & JONES COMPANY have purchased property on Water street, Pittsburgh, having a frontage of 70 feet and a depth of 160 feet, and will erect on this site a ten-story fire proof building to serve both as a warehouse and district sales office.

THE Committee on Public Buildings, Portland, Maine, at a recent meeting awarded to A. R. Turner, at his bid of $2697, the contract for heating and ventilating four school buildings. Wiley & Calhoun secured the contract for plumbing the school house at Lunt's Corner, Ocean street and Deering Center, and the plumbing of the Saunders Street School was awarded to James Miller.

A FIRE, of unknown origin, on July 25, did damage to the extent of $3500 to the stock and building occupied by the N. O. Nelson Mfg. Company at the southeast corner of Eighth and St. Charles streets, St. Louis, Mo.

GEORGE D. WORRELL of Mount Holly, N. J., bid $1448 and secured the contract for plumbing the new model school building at Princeton, N. J. Mr. Worrell has purchased a shop in Princeton on Alexander street and will conduct a plumbing and heating establishment there.

A. C. THOMPSON & Co. bid $8000 and secured the contract for heating, plumbing and ventilating the new Court House at Sydney, Cape Breton.

THE LOUIS LIPP COMPANY, Cincinnati, Ohio, have purchased a tract of ground at the intersection of Mitchell Avenue and the B. & O. S. W. R. R., Cincinnati, Ohio, the frontage on the railroad being 1500 feet, where they will at once commence the erection of new brick and stone structures as follows: Two main buildings fronting on Mitchell avenue and extending along the railroad 550 feet long by 100 feet wide each, and another large building will be used as a foundry and enameling shops. The company made a specialty of the production of Plumbing Goods, Bathtubs, &c., and one of the buildings will be used exclusively for the production of Plumbers' Wood Work used in connection with Bathtubs, Closets and Tanks. The entire plant, it is stated, will be the largest of its kind that is independent of the combination. The officers of the concern are Louis Lipp president and Albert Weil secretary and treasurer.

THE Board of Health of North Adams, Mass., have appointed Peter Connors, L. A. Weston and Fred Todd as a board of plumbing examiners.

THE Board of School Commissioners of Indianapolis, Ind., will receive bids until August 16 for a steam heating plant for School No. 45, at Park avenue and Twenty-third street, in that city.

THE NATIONAL FILTER COMPANY OF NEW YORK, 15 East Fourteenth street, New York, is the name of a new company recently formed to take over the business of the Gate City Filter Company. They are manufacturers of and dealers in all types of Water Filters for household and general use, including the Morrison Gravity and Pressure Filters. The company will also exclusively manufacture the Gate City Gravity and Pressure Water Filters, as well as representing directly for the Atlantic States and export trade the National Tripoline Company, from whose mines in Missouri the natural filtering stone is taken. The National Tripoline Company are manufacturers of all kinds of Tripoli products, including Filter Tubes, Cylinders, Blocks, Disks and shapes of all sizes and proportions, together with Tripoli in various colors and degrees of fineness.

THE WILLIAM POWELL COMPANY, Cincinnati, Ohio, manufacturers of Steam Brass Goods, will shortly enlarge their pattern shop and foundry by the erection of substantial additions, as these departments are at present overcrowded.

THE CHAPMAN VALVE MFG. COMPANY, Indian Orchard, Mass., will begin work at once on an addition to the main building, 40 x 22 feet, one story high, which will be used for a japan room.

THE works of the Atlantic Tube Company, at Beaver Falls, Pa., will be offered for sale by order of the receiver on August 6. The plant makes Seamless Tubes and it is probable it will be bought in by the bondholders.

THE PITTSBURGH SEAMLESS TUBE COMPANY of Pittsburgh will apply for a charter on August 16. The concern propose to build a works in that city for the making of Steel Tubes.

THE AMERICAN SPIRAL PIPE COMPANY, manufacturers of Spiral Riveted Pipe, will erect a building for their special purposes on Paulina street, south of Blue Island

avenue, Chicago. It will cover a ground space of 80 x 150 feet.

THE Supervising Architect at Washington, D. C., will receive bids until August 21 for a complete heating apparatus in the United States Post Office at Elgin, Ill.

THE F. L. SMITH PLUMBING & HEATING COMPANY of Pawtucket, R. I., have taken a contract to install six Gurney Steam Heaters and do the plumbing in four new houses for Herbert E. Sadler of South Attleboro, Mass. They are also using two Gurney Boilers in houses being erected by George Broadbent, in their town.

O'TOOLE BROTHERS, Clinton, Conn., are putting the Kelsey system of heating in the Jefferson House, at Groton, Conn.

THE BROOKLYN GALVANIZING & MFG. COMPANY, corner of Kent avenue and North Tenth street, Brooklyn, N. Y., have informed the plumbing supply trade that they have enlarged their facilities, and have also increased their large and varied assortment of stock at their Kent avenue works, in order to insure their customers prompter deliveries in either Black or Galvanized goods. The Brooklyn Galvanizing & Mfg. Company are owned by the Foran Foundry & Machine Company of Flemington, N. J.

DURING the hot weather the benefit to horses derived from a shower bath has been quite noticeable, and John O'Brien, superintendent of the City Water Works of Waterbury, Conn., has devised a special shower bath apparatus for this purpose. He ran up an ordinary iron pipe to a point about 8 feet above the ground and connected a cross pipe having a sprinkler at each end. These sprinklers were arranged to throw a spray, and the distance between them was adjusted so that the entire body and head of a horse would be readily subjected to the cool shower. Where this shower bath is used judiciously, there can be no doubt of the benefit attending its use.

PLUMBERS who desire some better method of connecting soil pipe when a new length or a new fixture is inserted than the old method of taking the lead out of several joints and springing the stack into line should send to the Vanderman Plumbing & Heating Company, Willimantic, Conn., and get one of the little cast iron models of the Vandermau Insertable Joint. The casting is less than 1 inch in diameter at its largest point and is made in two parts, the hub end being a little over 2 inches long and the hub occupying practically the whole length. The hub is threaded on the inside, while the spigot is threaded on the outside. The full sized fitting will lengthen some 6 or 7 inches when put into place, so that it is a simple matter to insert this expansion joint, then screw up the spigot end until it connects with the length of soil pipe above sufficiently to make a secure connection by calking with oakum, then with lead a perfectly tight joint is easily made.

A FIRE did slight damage to the plumbing establishment of John Atkins, on Broadway, Watervliet, N. Y., last week.

EDWARD H. LITTLE, formerly manager of the Brooklyn Galvanizing & Mfg. Company, has severed his connection with that company and is no longer affiliated with them in any capacity whatsoever. We understand Mr. Little is going into the galvanizing business on his own account.

SPARKS from a locomotive set fire to the roof of the plant of the Stewart Heater Company on Norfolk avenue, Buffalo, N. Y. The damage done to the machinery and goods by the fire and by water in putting out the fire will amount to about $5000.

A FIRE broke out in the plumbing establishment of J. B. Snyder, 34-36 South avenue, Rochester, N. Y., last week, doing damage to the extent of $5000, which was fully covered by insurance. The fire also damaged the plant of the Genessee Plating Company to the extent of $3000, and Barr & Creelman, plumbers, sustained a loss of $4000, covered by insurance.

THE COMBINATION RUBBER & BELTING COMPANY, Bloomfield, N. J., manufacturers of Mechanical Rubber Goods and also sole manufacturers of the genuine Plumbers' Boss Washers, have notified the trade that J. A. Moody, who for the past 30 years has been connected with the New York Belting & Packing Company in an important position, is now in charge of their trade in Greater New York. Mr. Moody knows the rubber business thoroughly and is in a position to quote upon the exact goods which may be needed.

THOMPSON BROTHERS, Philadelphia, bid $6750 and secured the contract for installing a heating and ventilating plant at Nineteenth and Ludlow streets, in that city.

PLUMBING INSPECTOR AVERY of Holyoke, Mass., at the request of the Massachusetts Civil Service Commission, has forwarded affidavits as to his work for five years previous to his appointment and the names of his employers. This was done in response to the protest of plumbers who thought the appointment illegal. The Civil Service Commission have expressed satisfaction as to the affidavits and further steps against the appointment will have to be made through the Superior Court.

F. D. STOLZ, 115 Lake street, Chicago, reports a steadily increasing demand for the Hot Water Heaters recently brought out by him to be used in connection with Warm Air Furnaces. He finds a growing tendency to install combination heating in new buildings, to secure the advantage of ventilating with the positive action of the hot water heating apparatus. A great deal of repairing is also being done, in which combination heating is being installed to take the place of a single system previously used. The prospect for business this fall is remarkably bright. Mr. Stolz finds that buyers are making up their minds more quickly than usual, as people are prosperous and feel that they can spare the money to make desired improvements.

T. H. STEVENS, who is well known to the heating and plumbing trade throughout the country, is sending out an announcement that he has opened an office at 23 West Twenty-fourth street, New York, where he offers his services as plumbing and heating engineer. The announcement states that having had 20 years' experience as a practical man in heating and plumbing on some of the best buildings in New York and throughout the country, and also as inspector of plumbing and draftsman in the preparation of plans and specifications for plumbing and heating and in superintending construction, he offers his services to architects and others who require the services of a specialist in his line. Mr. Stevens has also acted as general superintendent of construction for the Building & Sanitary Construction Company, and he gives a long list of prominent plumbers, architects and plumbing goods houses as references.

FOR alleged violation of the regulations of the Board of Health Isaac T. Jones, plumber, of Hudson, Mass., was summoned to appear before Judge James W. McDonald of Marlboro July 27. This case was brought to test the legality of the board. Mr. Jones refused to comply with its rules and regulations on the grounds that it is illegally constituted, inasmuch as there is no physician on the board, and which is not in keeping with chapter 218, section 3, of the acts of 1894. In return, the Board of Health argues that at the annual spring election it was impossible to gain the consent of a physician to be a candidate for the office, and a layman was chosen.

AFTER being out on a strike for 12 weeks, the journeymen plumbers of San Antonio, Texas, have gone back to work under old conditions.

J. H. CASLER, Buffalo, N. Y., who is well known to the plumbing and heating trade throughout the country, is sending out a letter announcing that he has secured a private dwelling at 79 Norwood avenue, Buffalo, within ten minutes of the Pan-American Exposition grounds and in the finest residence district of the city, where he can accommodate 40 people. Doubtless many who will attend the exposition will be glad to find such accommodations, particularly as the rates are extremely moderate.

THE PIERCE, BUTLER & PIERCE MFG. COMPANY, Syracuse, N. Y., are sending to the trade a special mailing folder, red in color, devoted to the Pierce Silent Water Closet, No. 10, which is of the siphon type and shown

with a low down tank and the company's new vertical vent, which they claim is a distinct advance in local or seat ventilation, while the Closet embodies all the desirable features of the most modern goods. The house are also putting on the market a cast iron tank leg which will be found convenient by those who equip apartment houses with a hot water supply system. These Legs are a special casting designed to support a heavy weight. They can be used in sets of three or more for supporting hot water storage tanks used in connection with tank heaters.

The Burley Heater Company, Tyrone, Pa., report a large number of orders for their improved Heating Apparatus, which they consider proof that the new features presented in it have increased its popularity with the trade. They now manufacture every part in their own plant.

Joseph McWilliams & Co., Louisville, Ky., has been awarded the contract for the Steam Heat and Ventilating Apparatus for the New Orleans Custom House. The price is $33,870.

New Firms and Changes.

The National Steam Heating Company, with principal office in the Corporation Trust Company Building, 15 Exchange Place, Jersey City, N. J., have been incorporated with a capital stock of $130,000 by Robert C. Adams, Horace S. Gould and Evan J. Dudley. They will conduct a steam heating business.

Arrott Brothers & Co. have purchased 8½ acres of land at Colonia, near Monaca, Pa., on the Ohio River, and have applied for a permit for a corporation to be known as the United States Sanitary Mfg. Company, with a capital stock of $100,000. The plant will be large enough to employ 125 men at the outset and will be equipped with modern facilities for the manufacture of sanitary goods.

William P. Kirk, Bridgeport, Conn., formerly foreman for E. A. Creevey, has purchased Mr. Creevey's stock and fixtures and removed them to one of the stores in the Boys' Club Building, where he will carry on a general plumbing, heating and gas fitting business.

The Fred. D. Johnson Company of New York City have been organized with a capital of $10,000 by Fred. D. Johnson and W. L. Rushton of New York City and G. A. Pratt of Brooklyn, to manufacture steam heating apparatus.

Walter J. Braunsdorf and Edward A. Weaver, formerly with H. P. Blair & Co., at South Bend, Ind., have opened a plumbing shop at 221 South Michigan street, South Bend, under the firm name of Braunsdorf & Weaver.

The Louisville Gas Fixture Company, Louisville, Ky., have been incorporated with a capital stock of $10,000 by A. C. Montenegro, H. H. Bowen and others.

A. J. Small has leased the Cunningham store on East Main street, Waynesboro, Pa., and will engage in the plumbing and heating business.

The Sanitary Construction & Mfg. Company have been incorporated, with a capital of $50,000, at St. Paul, Minn., by George Kees, Raymond G. O'Malley and John A. Kees. The new company will manufacture and deal in Plumbers' and Gas Fitters' Supplies and carry on the business of plumbing and gas fitting.

The Loew Filter & Mfg. Company of New York City were recently organized with a capital stock of $50,000. The directors of the company are: C. H. Loew, Lakewood, Ohio; S. J. Cox, Cranford, N. J., and Herman Meyer, New York City.

The Cook Heating & Power Company are a new heating contracting house at 30 East Twentieth street, New York.

The Barron Heating & Power Company succeed the Barron & Cook Heating & Power Company at 26 Church street, New York.

The Union Engineering Company are a new heating contracting house at 95 Liberty street, New York. H. R. Stickney, who is well known to the heating trade, is their engineer.

E. W. Webster, Du Bois, Pa., who for the past seven years has been associated with the firm of Hibner, Hoover & Co., has purchased the plumbing and heating business of the company and enters into business for himself with bright prospects.

The Fruin & Walker Company, Chicago, Ill., were recently incorporated with a capital of $2500 for the purpose of manufacturing Pumps and Plumbers' Supplies. The incorporators of the company are J. L. Fruin, Michael Farrell and W. J. Walker.

The Coe Brass Company Buy the Chicago Brass Works.

Advices from Kenosha, Wis., state that the plant of the Chicago Brass Works has been transferred to the Coe Brass Company of Torrington, Conn., for a consideration of nearly $400,000. While the deal has been talked of for something like a year, the announcement of the sale came as a great surprise. The deal is an absolute sale, the Coe Brass Company having taken possession of not only the plant in Kenosha, but also of the brass store and office business of the company in Chicago. Many of the old men who are now with the brass works will remain, among the number who will have charge under the new management being F. L. Titsworth and J. K. Fletcher, the present superintendents of the plant.

With a capital stock of more than $3,000,000, the Coe Company have planned to make the Kenosha plant their Western outlet, and it is stated to be their purpose to control the entire trade west of the Mississippi River with brass from Kenosha. In order to do this elaborate arrangements are being considered for the enlargement of the plant.

The immediate demand is for room, and in order to fill this demand all the property now owned by the company will be covered with buildings. The present mill will remain, but it will be used largely for the manufacture of brass tubing, which has always been considered only a side issue by the former owners of the plant. A large mill will be built directly west of the present mill, and added to this another new building will be erected for the manufacture of copper.

Making Glue Size.

A writer in one of the furniture papers offers the following directions for making a good glue size: Put about 4 ounces of best white glue into a tin vessel and just cover with cold water; let this soak until so soft that you can press your finger through it, or for between two and three hours; then place the vessel into hot water and leave until the glue is perfectly dissolved. After that is accomplished put your thumb and first finger into the warm glue and pour in warm water slowly, stirring with your hand until you can feel one finger resist another. This is an indication that the glue is of the right consistency. When the fingers are first put in it will be impossible to feel them through the glue. This shows that it is too strong and needs the water as directed.

Action of Alcohol Upon Metals.

Dr. Malmejac, says *Science*, in his experiments used 95 per cent. alcohol, which left no residue on evaporation. The metals, copper, iron, tin, lead, zinc and galvanized iron, were corked up with alcohol in glass flasks and kept at ordinary temperatures for six months. The copper was entirely unacted upon, but in all the other flasks there was a deposit on the bottom and the metal was covered with a similar deposit. In the case of tin, lead, zinc and galvanized iron the deposit was white; that from iron was red, resembling iron rust. All of the liquids, except that in which the lead had been placed, filtered clear; the latter retained its milky appearance after repeated filterings through double filters. The clear filtrates from iron, lead, zinc and galvanized iron gave much residue on evaporation, while the residue from tin was hardly appreciable.

The Sheet and Tin Plate Strike.

Contrary to expectations entertained at the beginning of the week that the great strike in the union sheet, hoop and tin plate mills of the United States Steel Corporation would be brought to an early termination, the settlement of the dispute still seems nearly as far off as ever. The situation has reached a critical stage. The general Executive Committee of the Amalgamated Association has been in session in Pittsburgh since Tuesday considering the proposition made by J. P. Morgan to President Shaffer in New York last Saturday, when Mr. Shaffer, accompanied by John Williams, secretary of the Amalgamated Association, met with Mr. Morgan and C. M. Schwab, with the idea of arranging possible terms with the corporation, with a view to ending the strike.

The proposition made by Mr. Morgan to the association was to the effect that the United States Steel Corporation would agree to sign the scale for all union mills only, the nonunion mills to be run, as heretofore, without the scale being signed for them. In addition, it was stipulated that all union mills be open, and that nonunion men should be allowed to work in these mills without hindrance in any way from the Amalgamated Association. It is this last clause in the proposition that is regarded as the bone of contention which may prevent the settlement of the strike. It is not true that the United States Steel Corporation agreed to sign the scale for the McKeesport, Wellsville, Old Meadow and Scottdale mills, but, on the contrary, these plants are to be operated nonunion as heretofore.

The proposition made by Mr. Morgan to the Amalgamated was not by any means as favorable as the final proposition made by Warner Arms and others at the last conference held in Pittsburgh on Saturday night, July 13. Had it been as favorable it is pretty certain that it would have been accepted at once by the Amalgamated, as President Shaffer and his followers realize that the Amalgamated Association is doomed to certain defeat unless the strike is quickly settled. President Shaffer personally is understood to be in favor of accepting Mr. Morgan's proposition, but in this he is opposed by a majority of members in the Executive Committee.

The executive board of the Amalgamated Association, after meeting each day of this week and discussing the terms, is still in session at the time of writing, without any decision having been reached. On Thursday evening the following official statement was given out by that body:

We, the members of the General Executive Board of the Amalgamated Association, desire to deny emphatically the reports published expressive of disagreement among us. We are disposing of the work before the committee as fast as its importance will permit. No member has expressed any opinion or given any statement of the business, or of the attitude of other members. Nothing has been made public, neither will any report issue from us until a definite conclusion is reached. We are simply trying to reach a settlement which shall be honorable and satisfactory to all concerned.

While the chances for a settlement of the strike do not appear favorable at the moment, so much pressure is being brought to bear on both sides that, in the opinion of many, a compromise may yet be reached and the strike declared off. If the United States Steel Corporation would make as liberal an offer to the Amalgamated Association as was made in conference, the strike would probably be ended at once. If, on the other hand, the corporation refuse to modify Mr. Morgan's proposition, then a long and bitter fight seems likely. The strike may extend to some of the steel plants and blast furnaces, as well as the railways, entailing an immense amount of trouble and seriously affecting the business interests of the country. It is right to record that the strike, so far, has been conducted upon the most orderly lines. But should it extend it is a question whether such peaceful methods would continue. From every point of view, in the interest both of the manufacturers and the workmen, it is sincerely to be hoped that some method of settlement may speedily be arrived it.

A Large Stock of Sheets.

Joseph T. Ryerson & Son, 18 to 22 Milwaukee avenue, Chicago, are enjoying the fruits of their business sagacity and enterprise. They are among the largest steel merchants in the world, always carrying heavy stocks of plates, sheets, tubes, rivets and general boiler makers' supplies. This year they anticipated labor troubles in the sheet mills and greatly increased their purchases of black and galvanized sheets. They have thus placed themselves in excellent position not only to serve their old customers, but also to promptly supply the pressing necessities of a wider circle of buyers in the sheet trade, with whom business relations are extremely desirable. The stock sheet recently issued by this house presented a remarkable appearance for the times and conditions prevailing, showing heavy quantities of sheets of the standard sizes and gauges on hand in their warehouses and thus ready for immediate shipment.

Tin Plate Imports and Exports.

The official statement of imports and exports of merchandise into and from the United States during the fiscal year ended June 30, 1901, just issued, places the importations of tin plates during that period at 117,880,312 pounds, valued at $3,770,062, a falling off of about 30,000,000 pounds and $1,000,000 from the figures for the fiscal year 1900, which were 137,963,804 pounds, of a value of $4,799,796. In the fiscal year 1899, 108,484,826 pounds of tin plates were imported, the value of which was placed at $2,613,564.

The exports of tin plates from the United States in the fiscal year ended June 30, 1901, amounted to 1,367,405 pounds, valued at $66,550, as compared with 319,579 pounds, of a value of $19,062, in the preceding fiscal year, and 205,910 pounds, valued at $10,045, in the fiscal year 1899.

Fire Proof Sash and Window Frames.

The St. Paul Roofing, Cornice & Ornament Company, St. Paul, Minn., have issued a neat illustrated catalogue of sheet metal window frames, casings and sash. The company have designed these frames, casings and sash to meet the necessity for fire proof trimmings to be used in finishing fire proof buildings, and thus afford additional safeguards against fire. They manufacture two styles of fire proof windows, one named Perfection and the other Standard. The Perfection window is especially adapted for extra large windows where great strength is required, or when plate or other breakable glass is used, which can be replaced from the inside without removing the sash from the frame. The glass is held in place by a detachable metal stop, no bolts or screws being used. This sash can be hung with weights, or spring balances may be used for the smaller sizes. The Standard window is lighter than the Perfection, containing less material, and is especially adapted for wire glass windows for warehouses, &c., of ordinary sizes. The glass in this sash is inserted through an opening in the top rail, which has a detachable cap to close the opening after the glass has been set. The company also manufacture metal covered plain and paneled doors. The catalogue shows a large number of designs of stock metal moldings used in their interior trim and store sash, as well as corridor trim.

Tinsmiths and Sheet Metal workers generally will be interested in Callahan's Soldering Fluid, made by George Callahan & Co., 218 Front street, New York. It is claimed that this Fluid is noncorrosive and nonpoisonous. It is said to keep the soldering iron clean and is as well adapted for Galvanized Iron as for Tin and Copper. It is said to tin the soldering Copper instantly and that it is not necessary to file the Copper after it is forged. Owing to the fact that it does not cause rust or corrosion the Fluid is well adapted for use in repairing roofs.

UTILIZATION OF TIN SCRAP.

When first I turned my attention to the subject, says Prof. Joseph Richards, in the *Journal* of the Franklin Institute, I found that large quantities of tin scrap and galvanized iron were every day carted to the dumps. I found that the average coating on scrap tin, tin as tin on plate, was 3 per cent.; that the iron, if properly cleaned, could be used in the knobbling furnace and in the puddling furnace; that the use of galvanized iron was a necessary part of the process; and it looked so encouraging that we decided to build a plant to work it on a commercial scale.

I procured a half dozen of the larger beer casks used for storage, and which are about 6 feet in diameter and 6 feet deep. After removing the heads they were placed in the ground in a semicircle and a crane was rigged up that commanded all the tanks. In the first tank was charged hydrochloric acid; in the second, water; in the third, water with a little lime; in the fourth, water; and in the fifth, a solution of copper sulphate.

The plan of work was to fill a large wooden cage that would hold loosely about 200 pounds of the clippings. This was swung on the crane and placed in No. 1 tank. In ten minutes' time the crane was raised and the clippings examined to see if the tin was dissolved. If so, the cage was then lifted out of the acid tank and another cage filled with clippings took its place. The cleaned scrap was washed in the water tank No. 2, lifted up and down to well wash it, and then immersed in the lime tank, No. 3. This neutralized all the residual acid that was left in the pores of the iron. The untinned and limed scrap was then moved to water tank No. 4 for a final washing, then plunged for a moment, just enough to submerge it, in the copper sulphate solution, then immediately removed. The object of this treatment was to form an exceedingly thin film on the iron, to prevent the rusting of the clean iron, which is so sensitive when exposed to the air that it will almost immediately cover itself with rust. The cleaned scrap was compressed in a drop press into balls, and in this form was shipped to the iron works and worked into blooms for sheets, commanding a price of from $10 to $12 per ton.

After the process had been continued for some time all the acid in No. 1 tank would become neutralized and we would have a solution of chloride of tin.

The process of tin cleaning stopped here for a while. We then took a cage of galvanized iron scraps, filling the cage loosely. When the zinc came in contact with the tin solution the metallic zinc took the place of the tin, forming zinc chloride, and all the tin was precipitated as metallic tin, in a finely divided state. We worked this plant successfully for some time, recovering, when melted into ingots, about 600 pounds of tin from 10 tons of scrap. The recovered iron commanded $10 per ton and the zinc chloride $20 per barrel, for disinfectant purposes and for treating wood to make it fire proof.

We finally closed the works because of the objectionable vapors that annoyed our neighbors, with the intention of rebuilding on the swamps near Chester; but other things prevented us doing so. I yet think it is the best and most profitable means of utilizing this scrap, especially if electricity is used for the deposition of the tin.

H. J. Lawson's New Cornice Building.

In order to meet the growing demands of his cornice and sheet metal business H. J. Lawson has recently completed a new building on Auburn street, Manchester, N. H., where he will in future attend to the wants of his customers. For some time he was in business on Lowell street, but the old quarters becoming inadequate, he constructed this new building in accordance with plans prepared by himself and designed with the special view to the use to which it was to be put. The structure is three stories in hight, the front being finished in copper. The basement is used for a storeroom, the first floor for coppersmith work and the second floor carries the machinery for making small work. The building was erected according to what is known as "mill" construction, and on the side toward the adjoining building the windows are rendered as nearly as possible fire proof by using sheet metal frames and casings in combination with wire glass. The interior walls and ceilings are of steel.

Tin Mining in the Malay Peninsula.

A special mining commission of the London *Economist* reports as follows:

The lower half of the Malay Peninsula consists of the States of Perak, Selangor, Pahang, Negri Sembilan and Johore. The first four are known as the Federated Malay States—which are under the protection of Great Britain—and Johore will probably enter the Federation sooner or later. To the north of these are numerous other Malay States, quite unexplored as yet. These are nominally under Siamese influence, and are closed to European exploitation. The Federated Malay States, especially Perak and Selangor, contain by far the largest and richest tin mining fields known, and as they supply at present about four-sevenths of the world's output of tin their importance from the mining point of view can be easily imagined. These great tin deposits stretch from the north, through the independent Malay States, into Siam, and the province of Yunnan, in China, and south into Sumatra, Banca, Billiton and other of the Dutch Indies.

A rough estimate of the world's present yearly supply of tin may be stated as follows:

	Per annum. Tons.
Federated Malay States	45,000
Independent Malay States, Siam and Yunnan	4,000
Dutch Indies	15,000
Australia and Tasmania	3,000
Bolivia and Peru	4,000
Cornwall	4,000
Total	75,000

The question naturally arises, Is the output of tin going to increase? Will not the present high price before long have the effect of bringing many more producers into the market?

But tin is a metal which, relatively to copper, lead, silver and gold, is found in few countries, and I am inclined to think that the output, except in the Malay Peninsula itself, will not increase to any appreciable extent. In the Federated Malay States I can see no sign of waning in production, and when they are worked out, many years hence, the at present unexplored States in the north of the peninsula will doubtless continue to supply the world.

In the Federated States many of the richest patches of the alluvial tin bearing wash have already been worked out; but the lower grade areas, which now, owing to the higher price for tin, are as highly profitable to work as the richer ones used to be, appear to be of almost unlimited extent.

Every here and there you come upon one of these mines. From out of the big shallow holes thousands of Chinese coolies pour, carrying on their heads baskets of the tin bearing gravel, which they empty into the sluices, and as the endless stream passes and repasses, one's belief in the permanence of this industry is crystallized.

On every side, too, you see dense tropical forests. One glance will tell you that, as this land is cleared and prospected, thousands of acres of alluvial tin carrying areas will be exposed, the existence of which is not now known. But the Government is very wisely putting a stop to the habit of taking up only the richest areas. The poorer lands must be worked out first, especially with the present high price for tin, and in days to come the output can be regulated and the revenue assured.

Practically the whole of the tin areas are owned and worked by Chinese, and some of the wealthiest proprietors now estimate their fortunes in millions of dollars. Europeans have found, by costly experience, that the Chinese coolie, in tin mining, will give a fair day's work only to a Chinese master, and unless they can introduce hydraulic sluicing profitably their share in the tin mining industry will be an insignificant one.

CHARLES G. ZUG of Zug & Co., Limited, Sheet makers, of Pittsburgh, has sailed for Europe.

FLASHINGS.

THE AMERICAN ROLLING MILL COMPANY have resumed operations in their Sheet plant at Muskegon, Mich.

THE AMERICAN SHEET STEEL COMPANY have opened offices at Canton, Ohio, which will be a center for the management of their plants at Canton, Dresden, Niles, Dennison and New Philadelphia, Ohio.

THE factory of Hemp & Co., Tin and Sheet Metal manufaeturers, at 906-910 South Second street, St. Louis, Mo., was destroyed by fire last week.

W. S. BULLARD, Bridgeport, Conn., is putting on new roofing and repairing the old roofs at the plant of the Aeme Shear Company, in that city.

MOSES MALE, one of the pioneer Slate men of Amerieа, died recently at Pen Argyl, Pa. He was a native of Cornwall, England, and came to this eountry when the Pennsylvania Slate fields were first opened, nearly half a century ago.

A LOS ANGELES DISPATCH to the New York *Commercial* states that a number of prominent eitizens of that place have taken hold of a Tin mining claim that has been discovered in Orange County, Cal., on the south slope of the Temescal Mountains, and propose to develop it. It will be remembered that a British syndicate several years ago undertook to exploit Tin mines in the same region, but the venture was unsuccessful, owing, it is claimed, to poor management.

WARNER ARMS, second vice-president of the American Tin Plate Company, had a narrow escape from serious injury a few days ago, the carriage in which he was driving from the station at New Roehelle, N. Y., having been struck and smashed by an electric ear. Mr. Arms, his wife and daughter escaped with nothing beyond a severe shaking, but the coachman was seriously hurt.

HENRY WEYAND, Waterbury, Conn., has the contract for the plumbing and tinning on a six-tenement block which J. E. Carey is building on Williams street. Mr. Weyand is also getting out a large order of Skylights for the Hotchkiss Bros. Company of Torrington, Conn.

WE have received from the Berger Mfg. Company a reprint of an article published in the *Stoves and Hardware Reporter*, illustrating and describing the company's new branch at 19-21 South Main street, St. Louis, Mo. The opening of this establishment has provided the concern with greatly extended facilities for the transaetion of their business in the Southwest, which has increased materially of late under the management of S. Y. Buckman. The building is three stories high, with a basement, each floor having dimensions of 50 x 160 feet, giving a total floor area of 24,000 square feet. This large space affords materially increased capacity for carrying stocks of the company's various products in the line of Tin Plates, Sheet Iron, Roofers' and Tinners' Supplies, &c. An interesting feature connected with this building is the fact that it occupies the site of the house of Maxent, Laclede & Co., in which civil government was first established in St. Louis by Capt. Louis St. Ange De Bellerive in 1766. A handsome tablet giving this interesting historical information is affixed to the front of the building.

L'Echo des Mines of Paris reports that a French company have recently started operations under a concession to mine for Tin at Blond Mountain, near the town of Valry, in France. It is stated that Tin deposits have been found in the form of cassiterite in that region. The Ore is said to be widely distributed, but so far has been found only in small quantities.

W. J. BURTON & Co., 164 and 166 Larned street, West, Detroit, Mich., advise us that although Galvanized Sheets and Tin Plates have become very hard to find for prompt delivery, they are still able to fill all orders for their regular kinds and sizes by first freight from their stock in Detroit.

F. L. THRASHER, who conducted a Sheet Metal working business at 161 Dwight street, Springfield, Mass., died at his home last week.

A PRESS DISPATCH from Connellsville, Pa., states that George J. Humbert, formerly district manager of the American Tin Plate Company in that locality, is at the head of a movement to erect a ten-mill Tin Plate plant at South Connellsville, which will be run independently of the combination.

THE plant of the American Can Company, at Youngstown, Ohio, is to be removed to Cleveland, Ohio, where it will be operated in connection with the company's factory in that city. The removal of the Youngstown plant is a disappointment to that city, as it was expected that Youngstown would be one of the centers of production of Tin Cans under the consolidation.

F. E. BEHNER, Hartford, Conn., has taken an extensive contract for Tin roofing at the State Prison, at Wethersfield, Conn.

THE recent increase in the capital stock of the Youngstown Iron Sheet & Tube Company of Youngstown, Ohio, from $1,000,000 to $2,000,000, was in order to have money to erect an open hearth steel plant should the concern find, later on, that it is desirable to do so.

CUMMINGS BROS. of Holyoke, Mass., are doing the Slate roofing of the new residence of T. J. Green, Westfield, Mass., and L. E. Noble & Co. the plumbing and heating.

IMPORTS of Pig Tin into the United States in the fiscal year ended June 30, 1901, according to the official figures of the Treasury Bureau of Statistics, just issued, amounted to 73,091,890 pounds, valued at $19,805,551, an increase of about 3,000,000 pounds and $800,000 in value over the imports of the preceding fiscal year.

Metal Workers' School in Saxony.

E. Theophilus Liefeld, United States Consul at Freiburg, reports to the State Department that an exhibit of the work done by pupils of the Metal Workers' School at Rosswein has been recently held in Freibnrg, which showed the thoronghness of the instruction given in that institution. The school has an average of 60 to 70 students. These pupils are chiefly from Prussia and Saxony, but all sections of Germany are represented, and even Sweden and Austria. One of the conditions of admission is that the pupils should have had three years' practical experience. Many of the States of Germany are liberally aiding the school and granting free scholarships to worthy young men.

The school is provided with a technical library, reading and reference room, and has a large supply of scientific apparatus, electro motors, batteries, &c., and many practical models of buildings, machines, &c. Excursions are frequently made by the pupils to the large factories and mines of importance in the neighborhood. The course at the school lasts from one and one-half to two years, and embraces four departments—building, fine arts, machines and electrotechnics.

A great deal of attention is given to drawing. The student is taught to create, and, in order to stimulate the inventive faculties, the German Patent Office sends the institution, free of charge, copies of patents pertaining to mechanical, metal and electric apparatus. In addition to the special branches in metal work, &c., attention is also given to physics, chemistry, algebra, geometry, bookkeeping and German language lessons.

The tuition fee for the *semester*, or half year, is 100 marks ($23.80) for citizens of the German Empire and 200 marks ($47.60) for foreigners, and an additional fee of 25 marks (for foreigners 50 marks, or $11.90) for the use of apparatus, machines and material. The city of Rosswein has about 8000 inhabitants and is situated on the main railroad line between Leipzig and Dresden.

It is understood that negotiations have been going on for the consolidation of the rubber manufacturing business of the United States on a plan similar to that of the United States Steel Corporation. The concern will be composed of the larger crude rubber companies and the leading manufacturers of rubber goods. Charles R. Flint and other representatives of heavy interests in the rubber trade are said to be behind the deal.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

MAKING ROOF FLANGES.

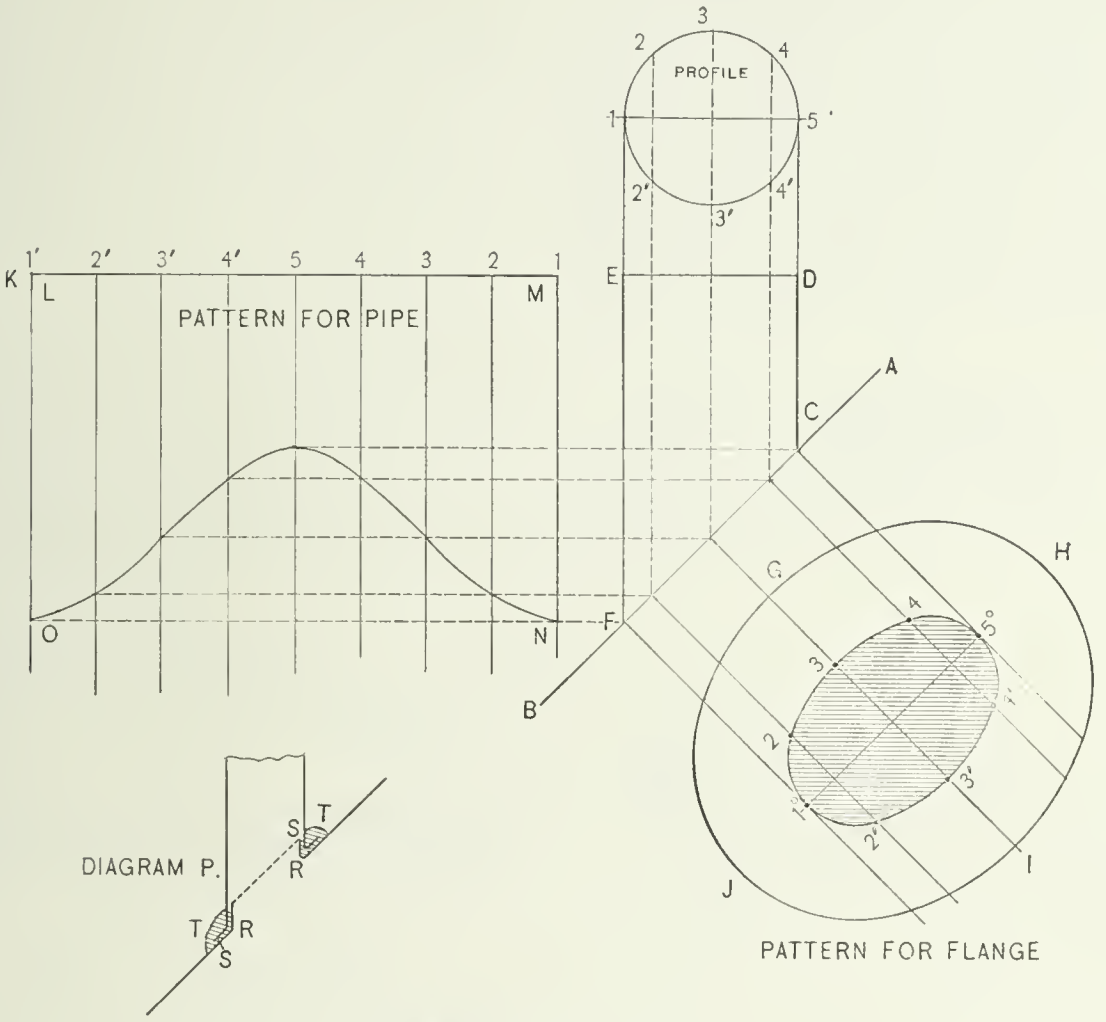
From T. W. Q., West Newton, Mass.—Will you please give me through the Letter Box Department directions for making roof flanges of copper adapted to different pitches, as indicated in the sketch herewith?

Answer.—In the accompanying illustration are shown the principles employed in obtaining a roof flange for a round pipe, the roof having an angle of 45 degrees. In this connection it may be proper to remark that no matter what may be the shape of the pipe, or what the pitch of the roof, the principles described are applicable to any case, whether the flanges are made of copper, zinc, galvanized iron, tin or sheet lead. Referring to the illustration, let A B represent the pitch of the roof and C D E F the round pipe fitting on it. In its proper position above the pipe place the profile, as shown, which divide into equal spaces, as indicated by the small figures 1 to 5. From these small figures, at right angles to 1 5, drop lines intersecting the roof line A B, as shown.

From these intersections and at right angles to A B draw lines indefinitely, as shown. Now parallel to A B draw the line 1° 5°.

Now, measuring in each instance from the line 1 5 in the profile, take the various distances to points 2, 3 and 4 or 2′, 3′ and 4′, and place them on similar numbered lines in the pattern, measuring in every instance from the line 1° 5°, thus obtaining points 2, 3 and 4 or 2′, 3′ and 4′. A line traced through these points, as shown by the shaded portion, will be the pattern for the opening to receive the pipe. The width of the flange, however, will vary according to the style of roof in use. If the roof is of metal, which allows soldering, a flange of 2 inches all around is sufficient, while if the roof is slate, tile or shingle an 8-inch flange is usually made. The flange is obtained by simply setting the dividers to the desired width and scribing around the opening, as is shown by G H I J.

For the pattern for the pipe mitering on the roof A B, extend the line D E of the pipe, as shown by D K, upon which place the stretchout of the profile of the pipe, as shown by the small figures on D K, at right angles to which and from these small figures draw lines indefinitely, as shown, which intersect with lines drawn at right angles to E F from intersections on A B. A line traced through intersections thus obtained, as shown by L M N O, will be the desired pattern, the seam being placed on E F to avoid leakage. In diagram P is shown the method of flanging the pipe and flange. R R shows an edge turned upward on the flange, while S S shows the edge turned outward on the pipe. The flange and pipe fit snugly and are then "sweated" with solder, as shown by T T, which completes the job.



Making Roof Flanges.

SMALL FLUES HINDER HEATING.

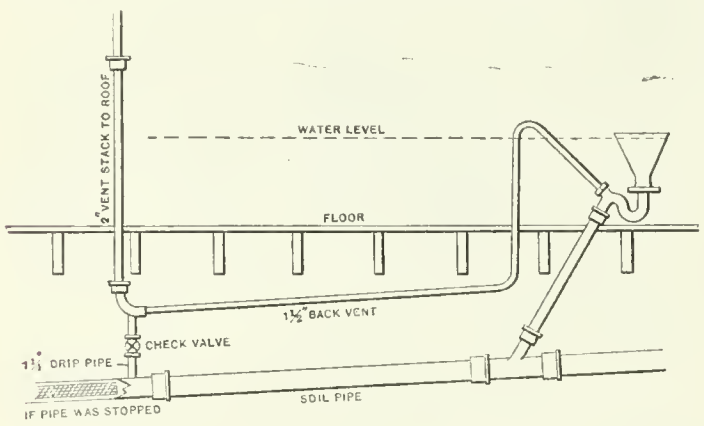
From J. T. B., Putnam, Conn.—With regard to the plans of the furnace job on which I asked assistance in *The Metal Worker* of July 13, I think there has been a mistake in marking the dining room and sitting room as being 18 x 20 x 8 feet instead of 13 x 20 x 8 feet, as the rooms actually are. You have selected the title, "Small Flues Hinder Heating," and I have based my calculations for the size of the flues on the provision of 1 square inch of area in the hot air pipe to 25 cubic feet of space for rooms on the first floor, and 1 square inch to 30 cubic feet of space for rooms on the second floor. The sitting room contains a chimney, which reduces the space 120 cubic feet, and the sewing room opens into the sitting room, only being divided from it by portieres, which are looped back, giving a total space of 2890 cubic feet in both rooms. My flue capacity is 128 square inches, or a proportion of 1 square inch to 23 cubic feet of space. The dining room, which is on the south side of the building with one wall exposed and the same conditions in regard to the chimney, has but 2080 cubic feet of space. The largest bedroom has 1260 cubic feet of space with

50 sqnare inches of area in the hot air fine, or a proportion of 1 square inch to 23 cubic feet. This room is on the north side of the house. I shonld be glad to be informed if my calculations are wrong and how to correct them.

Answer.—In selecting the title, "Small Flues Hinder Heating," reference was intended to be made only to the hot air stacks in the partition walls, which in all probability are not larger than 4 x 12 inches, and having an area of 48 inches, in which form the capacity for carrying the air wonld not compare at all favorably with the capacity of an 8-inch round pipe. The lack of air carrying capacity naturally would more seriously affect the heating of the first floor. The hot air pipes have been carried to the further side of the different rooms and there can be no doubt but shorter pipes, connected with floor registers in the dining and sitting rooms near the chimney, would make a very great improvement in the heating of the house. The views of the contributor presented in *The Metal Worker* of July 20 are worthy of carcful consideration, as they present valuable suggestions of a practical character. There is no error in the method of calculation adopted. With shorter pipes, connected to the floor registers, or with upright flues having a capacity equal to the hot air pipes, it is probable that the whole cause of trouble wonld have been avoided. The dimensions given on the plan presented in *The Metal Worker* of July 13 are 13 x 20 x 8 feet, and not 18 x 20 x 8 feet, as our correspondent has understood them.

A QUESTION FOR THE PLUMBING INSPECTOR.

From N. J., Webster, Mass.—Will *The Metal Worker* give me some assistance on the problem of back air ventilating shown in the accompanying sketch, which is a



A Question for the Plumbing Inspector.

little out of the ordinary? In this instance the back air pipe cannot be carried directly up in the usual way; it must be dropped down through the floor and then run off 10 feet in the cellar before it can be carried np through the roof. I propose to make the lowest place in the back air pipe at the point where it turns upward. At this point I would connect a 1¼-inch drip pipe and rnn it into the horizontal soil pipe, as shown. If the sewer pipe should be clogged up at the end, as shown, the water would find its level through the drip and fill up the back air pipe, which might clog it and render it useless. I propose to place a 1¼-inch check valve between the back air pipe and the sewer. Would this be proper, or is there a better way of doing the work where it is impossible to run the vent pipe directly npward?

Note.—It would seem that this is a question for the local plnmbing inspector and the Health Department. The plan should be brought to their attention, and if they will not permit the work to be done as shown, suggestions may be made that would be acceptable to them. We shall be glad to hear from our plumbing readers on this point. It is doubtful if a check valve on the drip pipe would be considered with favor by experienced plumbers. It would appear that the back air pipe from the closet should be the same size all the way to its connection with the soil pipe, if permitted. The proposed arrangement of vent pipe would cause the air rushing in to prevent siphonage to make many sharp turns. It is probable that under favorable conditions it might effect the desired result. On the other hand, it is doubtful if there would be such a circulation of air through such an arrangement of vent pipe as wonld dilute the air in the drainage system to the extent of destroying its corroding effect. Apparently, the arrangement of this pipe effectually disposes of condensation.

CLEANING AND TINNING OLD CANS.

From G. J. Z., Harrisburg, Pa.—Will you give me some information in regard to cleaning and tinning some old galvanized iron cans? These cans are used in making ice and they are more or less rusty. I have a great deal of bother in cleaning the cans, which takes a lot of time. My method is to clean them first with sulphuric acid cut in water, which takes most of the rust off. I then wash them with pure water, after which I apply muriatic acid cut with zinc. They are then put in a pan of melted solder. With a soldering iron I get the inside fairly well covered, but the hot solder seems to dry the acid on the outside, particularly on the bottom, and the solder will not stick. Can you give any way of making the solder take on the bottom of the cans without going all over the bottom with a soldering iron, which takes too much time? I have a big lot of cans to clean and retin and should be pleased to get any information that will aid me in retinning them.

Answer.—Ice cans that have been galvanized, as generally understood, are coated with zinc. Such cans should be treated to a melted zinc bath in the same manner as originally done. To tin them with solder, which is composed of tin and lead alloy, does not give any satisfactory results unless a large bath of melted solder is used, so that the cans can be immersed, when with a proper application of a solution of muriate of zinc and sal ammoniac the solder should readily flow on every part of the can. In trying to cover the surface which has been galvanized (zincked) the zinc thickens the solder and prevents its property of fluidity, which is the cause of the trouble. If the cans were originally tinned, then by adding sal ammoniac to the muriate of zinc the work will turn out better.

WHO MAKES THE MILAN VENTILATOR?

From J. S., Youngstown, Ohio.—Can you or any of your readers tell us who makes the Milan ventilator?

The Scarcity of Labor.

A scarcity of ordinary laborers prevails throughout the Northwest. Mannfacturers find great difficnlty in seenring a sufficient snpply of this class of workmen for the operation of factories. In some instances the scarcity has proved so great that efforts have been made to engage laborers in distant parts of the country. Last week trouble was threatened at Melrose Park, a Chicago snburb, by the divulgence of the plans of the Latrobe Steel & Coupler Company, who had arranged for a force of negro laborers from Alabama. The white citizens of the locality bitterly opposed the importation of the colored labor and threatened violence. The company concluded that it was wise not to cause trouble on this account, and abandoned the attempt. Other large employers of labor in Chicago and its vicinity wonld have been inclined to follow the example of the company if it had proved a successful experiment. The condition in the Northwest promises to become worse in this respect, as a strong demand now exists for harvest hands in the wheat fields of Minnesota and the Dakotas.

United States Consul Lyon of Hiogo, Japan, reports that an exposition will be held at Osaka from March 1 to July 1, 1903, which will include among other departments, mining, industrial, mechanical, sanitary and scientific exhibits. The objects to be exhibited will be those collected, produced or manufactured in the empire or by foreigners residing in Japan. The cost of the exposition will be defrayed by the imperial treasnry, but exhibitors will pay their own expenses.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin has fluctuated in price, closing at last week's figure; demand light.

Copper is dull and a trifle weaker.

Pig Lead is firm and quiet.

Spelter is very dull and without change in price.

Antimony is not active; prices unchanged.

Nickel remains strong and scarce.

Aluminum is in active demand at former prices.

Tin Plates continue scarce and high in price.

Sheets are also scarce, with prices strong for both Black and Galvanized.

Old Metals are dull and weak.

Foundry Pig Iron is more quiet and prices are inclined to waver.

Hardware is moving in excellent volume for the season and prices are generally firm.

Plumbers' Supplies are moving in fair volume, with prices firm and scarcity in some lines of goods.

Plumbers' Brass Work was advanced 5 per cent. July 29.

Steel Clad Bathtubs are scarce and strong in price.

Plumbers' Wood Work manufacturers are behind in deliveries; prices continue firm.

Wire Nails are active at unchanged prices.

Cut Nails are without change and in fair demand.

Wire is still in heavy demand, with prices strong.

Linseed Oil is firm at the advance.

METAL MARKET.

NEW YORK, August 2, 1901.

Pig Tin.—In the early part of the week the holders of Tin having secured all the spot metal available advanced prices about ½c. The demand, however, was very light throughout the week. The monthly statistics making an unfavorable showing, prices again declined, closing at about the same figures ruling at the date of our last report. The London market, at the close, was reported to be weak with little or no business doing. Straits Pig in small lots is quoted by jobbers at 28c. to 28¼c. per lb. The monthly statistics show that total shipments from the Straits in July were about the same as for that month last year. The arrivals at Atlantic ports during the month were moderate, being 1756 tons. Stocks at Atlantic ports on July 31 were placed at 2254 tons, and 2635 tons were afloat at that date. The total visible supply for Europe and the United States on July 31, as compiled by the New York Metal Exchange, was 1761 tons, an increase of 2295 tons over the figures of June 30.

Copper.—Following a sharp decline in the London market the market for Copper on this side was somewhat inclined to softness, and there were rumors that one of the larger producing interests was selling Lake Ingot at a price ½c. a lb. below the rates which have been quoted for some months past. It was difficult to find a substantiation of this report, however. Quotations for small lots were unchanged at 17¼c. to 17½c. per lb. for Lake Ingot, and 16¾c. to 17c. for Casting Copper. The domestic demand continues light and the export trade is also of very small proportions. Exports during July amounted to 7563 tons, against 9428 tons in June. The total exports from January 1 to July 1 inclusive were 39,295 tons less than for the corresponding period of last year.

Sheet Copper.—The manufacturers of Sheet Copper report a continued active demand, which keeps good pace with the production. Prices are firm and without change, small lots of Sheet Copper from store being quoted on the basis of 21c. per lb.

Pig Lead.—This metal is unchanged and without interesting developments, selling at the figures ruling for some months past. Small lots of American Pig are quoted at 4.60c. to 4.62½c. per lb. The demand is of moderate proportions and without special feature. St. Louis advices report a good run of orders for Pig Lead in that market, mostly calling for carload lots, with prices showing no change.

Spelter.—The market is extremely dull at unchanged figures, there being little or no demand from any quarter. Small lots of good Western brands are quoted at 4.45c. to 4.50c. per lb. in New York. Advices from St. Louis state that rumors are again heard of a Spelter combination. A meeting of those interested was held in that city on the 30th ult., but nothing definite was accomplished. The demand for Spelter in St. Louis is described as fairly active at former prices.

Sheet Zinc.—The demand for Sheet Zinc is of about the usual proportions. Jobbers quote 600-lb. cask lots at 6¾c. per lb. and smaller quantities at 7¼c.

Antimony.—Business is not active and prices remain unchanged. Cookson's, in small parcels, is quoted at 10½c. to 11c. per lb. and Hallett's at 8¾c. to 9½c.

Nickel—Is firm and unchanged. Small lots are quoted nominally at 60c. to 65c. per lb.

Aluminum.—A good demand at former prices is reported for this metal. No. 1 Ingot, guaranteed 99 per cent. pure, in small lots, is quoted at 37c. per lb. and 100-lb. lots 35c.

Tin Plates.—As compared with the rush of buyers last week, there was little doing in the Tin Plate market this week, partly because consumers were hoping that the strike situation would right itself and the mill wheels again begin to turn. This expectation, however, has not been justified so far by the event. Another potent reason for the falling off in the amount of business is the fact that neither manufacturers nor jobbers have much to sell in the line of Tin Plates. The market is practically bare of the more popular sizes of Coke Tins, and some of the consumers are beginning to feel the pinch of the scarcity very sharply. This is particularly the case with the Maine sardine canners, who have been caught very short of stocks and who are unable to obtain a sufficient supply of light weight Plates for their purpose. As their season is now on and is a comparatively short one, and they are forced to put up their supplies of fish without delay, it is feared they will undergo serious loss through lack of material wherewith to make their cans. In a similar way some of the fruit and vegetable growers will suffer great inconvenience, and it is likely that a number of the canning factories will have to shut down, entailing loss to both packers and growers. The available stocks of Tin Plates in second hands are rapidly becoming depleted, and orders are being turned down right and left by jobbers. Quotations are entirely nominal, holders who have anything to spare being able to obtain almost any price within reason that they choose to ask. The situation is becoming grave. Some orders for Tin Plates have been placed abroad, but buyers on this side are not inclined to invest very heavily in the foreign product, on account of the expense of importation and also because there are practically no spot stocks to be picked up in Wales. And no shipments of any volume could be expected from the other side much before the end of September, long before which time it is hoped that the domestic mills will again be in operation. It is only those consumers who must have Plates at any cost who are willing to buy the foreign product at the present high prices. The Tin Plate jobbers are consequently on the horns of a dilemma. While they do not care to import anything beyond what they can dispose of at once, on the other hand they cannot expect anything from the

American Tiu Plate Company for some mouths to come, even if the mills are started at an early date. It is almost useless to quote priees under the circumstances, as there are practically no current market rates, but it may be generally said that Bessemer Coke Plates, IC, 14 x 20, delivered at New York and Eastern points, cannot be had much under $6 to $6.25 a box.

Sheets.—The Sheet trade is now practically in the hands of the jobbers, as the mills iu operation are all sold up for three or four months to come and have nothing whatever to offer. The demand is of the same urgent character as for several months past and orders to almost any extent could be booked lf deliveries could be made. But, as stated above, the mills are so full of buslness that they can take on no more. Spot Black Sheets are impossible to obtain and jobbers who have stocks available are getting a handsome premium over the rates quoted by the American Sheet Steel Company. Galvanized Sheets are in somewhat better supply than Black. Shipments are coming in slowly from the mills and are snapped up as soon as they appear ou the market. New York jobbers are quoting No. 27 Oue Pass Cold Rolled Soft Steel Sheets at about 4.10c. to 4.15c., and Galvanized Sheets at 62½ and 5 per cent. to 65 per cent. off the llst.

Chicago advlces are as follows: Shipments from mills have beeu so heavily cut down that consumers are drawing largely from the stocks of the local jobbers. These stocks are rapidly disappearing. Some jobbers who usually carry large stocks now have only a few odd sizes in their warehouses. The fear that they may not be able to secure material for use when needed is causing many consumers having contracts for future delivery to request jobbers to make shlpments now, for which they will pay curreut prices. Quotations have been advaneed and the minimum now asked by any of the jobbing houses is 3.70c. for No. 27 Black, while other houses quote 3.80c., and some sellers are holding for 4.10c. No. 20 is quoted in the same way from 3.40c. up to 3.70c. Tin Plates are getting very searce and jobbers have advanced their base priees 25c. per box durlng the week.

Old Metals.—Business is qulet and prices iuclined to irregularity. Dealers are payiug about the following for moderate sized lots, delivered at New York or corresponding poiuts:

Heavy Copper	per lb. 14¾c.
Light and Tinned Copper	per lb. 13¼c.
Heavy Brass	per lb. 10 c.
Light Brass	per lb. 8 c.
Lead	per lb. 4 c.
Tea Lead	per lb. 3½c.
Zinc	per lb. 2¾c.
No. 1 Pewter	per lb. 18½c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	$6.00
Wrought Iron Scrap, per gross ton	$10.50 to 11.00
Heavy Cast Scrap, per gross ton	10.00 to 10.25
Stove Plate Scrap, per gross ton	7.00 to 7.50
Burnt Iron, per gross ton	5.00 to 5.50

THE PIG IRON MARKET.

New York.—The market continues very quiet, purchasing being very limited. The pressure to sell has been renewed in some quarters and is believed to be connected with the prospect of an enlarged productiou in districts tributary to this market. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, $16 to $17.50; No. 2 X, $14.75 to $15.75; No. 2 Plain, $14 to $14.50; Tennessee and Alabama brands, No. 1 Foundry, $14.50 to $15; No. 2 Foundry, $14 to $14.50; No. 1 Soft, $14.50 to $15; No. 2 Soft, $14 to $14.50; No. 3 Foundry, $13.25 to $13.50; No. 4 Foundry, $12.75 to $13.25.

Chicago.—The volume of business now being transacted is much under the normal even for midsummer. Only one sale of 1000 tons of Southern Foundry Iron has been made, and a few trausaetions of from 50 to 200 tons are reported, the total of sales being very small. The foundrymen are awaiting the settlement of the various strikes. The leading Southern furnaee companies are marking up the prices of No. 1 Foundry Pig. We quote as follows:

Lake Superior Charcoal	$17.00 to $18.00
Local Coke Foundry, No. 1	15.50 to 16.00
Local Coke Foundry, No. 2	15.00 to 15.50
Local Coke Foundry, No. 3	14.50 to 15.00
Local Scotch, No. 1	15.75 to 16.25
Ohio Strong Softeners, No. 1	16.00 to 16.50
Southern Silvery, according to Silicon	14.90 to 15.15
Southern Coke, No. 1	14.65 to 14.90
Southern Coke, No. 2	14.15 to 14.40
Southern Coke, No. 3	13.65 to 13.90
Southern Coke, No. 1 Soft	14.65 to 14.90
Southern Coke, No. 2 Soft	14.15 to 14.40

Philadelphia.—There is quite a difference of opinion as regards the Pig Iron situation. Locally furnaces are well sold up, and with light stocks on hand makers of Pig Irou are disposed to hold prices pretty steady. Outside lots, however, are offered at low figures, and as a means of self protection some of the nearby furnaces have met the market, but apart from a few special cases there is no pressure for business at less than $15 for No. 2 X and $14.50 for No. 2 Plain, some in fact claim to be doing better than these figures. Under the circumstances uniformity is hardly possible, as the conditions vary iu almost each individual case. It cannot be said that the market is positively weak, but it is likely enough to turn that way unless some stimulation is applied within the next two or three weeks. The range of prices to-day is about as follows for city and nearby deliveries: No. 1 X Foundry, $15 to $16; No. 2 X Foundry, $15 to $15.25, and No. 2 Plain, $14.25 to $14.75.

Cincinnati.—Taking all the adverse conditions into consideration, one would naturally expect to find a pretty dull situation in the Pig Iron market. The summer season, the unusual heat and the question of strikes all operate against activity, yet in spite of all this season is considerably better than the average summer. There is a pretty fair demand for Foundry Iron of all grades. Occasionally a lot of 1000 tons is landed, but the general run is for 200-ton orders, and from that down to a single car, in the aggregate a reasonably fair tonnage. Prices, however, appear weak. The minimum figures given herewith have been shaded a fraction, so report says. There is no change in sight, though it is not at all unlikely that the market will assume a stronger appearance. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1	$13.50 to $13.75
Southern Coke, No. 2	13.00 to 13.25
Southern Coke, No. 3	12.25 to 12.75
Southern Coke, No. 4	11.75 to 12.00
Southern Coke, No. 1 Soft	13.50 to 13.75
Southern Coke, No. 2 Soft	13.00 to 13.25
Southern Coke, Gray Forge	11.75 to 12.00
Southern Coke, Mottled	11.75 to 12.00
Ohio Silvery, No. 1	15.50 to 16.00
Ohio Silvery, No. 2	14.50 to 15.00
Lake Superior Coke, No. 1	14.50 to 15.00
Lake Superior Coke, No. 2	14.00 to 14.50
Lake Superior Coke, No. 3	13.50 to 14.00

St. Louis.—The market is in a rather quiet condition, with no indication of any immediate improvement. Leading producers are maintaining prices, expressing the belief that lower quotations will not increase consumption. A few outside makers are shading prices, so that the markets, so far as prices are eoncerned, are somewhat unsettled. The market as a whole seems to be in a waiting condition, and the next few weeks will determine what course prices are likely to take. We quote as follows for eash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$14.25 to $14.50
Southern, No. 2 Foundry	13.50 to 13.75
Southern, No. 3 Foundry	13.00 to 13.25
Southern, No. 4 Foundry	12.50 to 12.75
No. 1 Soft	14.25 to 14.50
No. 2 Soft	13.50 to 13.75

CHICAGO REPORT.

Scrap Iron and Steel.—Cast and Wrought Scrap are quiet. Borings and Gas Pipe are a trifle dearer, because of scarcity. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.	
Country Wrought Scrap	$10.50 to	$11.00
Machinery Cast	10.00 to	....
Malleable Cast	10.00 to	11.00
Stove Plate (free from burnt)	7.00 to	7.50
Burnt Iron and Grate Bars	5.50 to	6.00
Sheet Iron and Hoops	6.00 to	7.00
Plow Steel	9.00 to	10.00
Breaking Stock	9.00 to	9.50
No. 2, such as Shovels, Hoes, &e	.... to	7.00
Old Boilers—whole (Iron)	.... to	7.00
Old Boilers (Iron) cut in single Sheets and Rings	9.50 to	10.00
Old Gas Pipe and Boiler Tubes	10.00 to	10.50

Cast Borings	4.00 to	4.25
Turnings	8.50 to	9.00
Horseshoes	11.00 to	....

Old Metals.—Business is dull. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy	14½c.
Copper Bottoms	13¼c.
Copper Clips	14 c.
Red Brass	13¼c.
Yellow Brass	10 c.
Red Brass Borings	11½c.
Yellow Brass Borings	9 c.
Light Brass	7¾c.
Pipe Lead	4 c.
Tea Lead	3½c.
Zinc	2¾c.
Pewter, No. 1	19 c.
Pewter, No. 2	10 c.

Old Rubber.—Conditions are unchanged. Buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose	$23.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7¾c.
Rubber Car Springs	....	4¾c.
Inside Bicycle Tubing	....	21 c.
Outside Tubing	....	7¼c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—The demand will now be light for a week or two. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.25	6.50
Kansas City, Mo	8.25	8.50

A discount of 10c. from these figures is allowed on all Coal ordered to be shipped in August.

THE HARDWARE TRADE.

Since our last report nothing has occurred to disturb the satisfactory and promising condition then existing. On the other hand, the situation has perceptibly improved in some of its main features. Chief among these is the termination of the drought which was working so much injury, especially to the corn crop. The coming of bountiful rains in the sections where they were most needed has done a great deal to relieve apprehension, and probably to secure throughout the country at large an average crop. The hope of a settlement of the strike of the iron workers is also having an excellent effect on the general feeling. The reaching of an understanding and the resumption of work in the mills affected by the strike would lessen the fear of a shortage of material, which has begun to be felt quite seriously in some directions, and at the same time tend to stimulate business. Already in several lines the influence of the strike is felt in advanced prices, principally for Sheets, Tin Plates and related goods, but the influence of the stoppage of the mills has also been felt in other branches of the trade.

The month of July has been quite an exceptional one in the volume of business transacted in Hardware and related trades. There has been a good deal of purchasing in liberal quantities, but not in a speculative way. Many merchants have recognized the danger of difficulty in getting orders filled and have bought so as to cover their requirements in good season. The volume of business, too, which the jobbers have been doing has been such as to keep their stocks pretty low, and it is generally conceded that the fall trade will open with a moderate supply of goods in the warehouses of the manufacturers, the bins of the jobbers and the shelves of the retailers.

Prices meanwhile are, as a rule, very steady, and even strong. Manufacturers are cautious about accepting orders in view of possible difficulty in executing them promptly on account of the scarcity of material or the overtaxing of their facilities. There is a good deal of revising of quotations, but values, on the whole, are substantially unchanged. There is some complaint about collections, as not unusually happens at this season, but the general situation is regarded as eminently satisfactory and sound. All classes of the trade are looking forward to a good business during the remainder of the year.

NOTES ON PRICES.

Plumbers' Supplies.—While business in Plumbers' and Steam Fitters' Supplies in this market is still rather quiet, so far as the city trade is concerned, the out of town demand keeps up in surprisingly good volume. Some of the leading jobbing houses state that they did the largest July trade in their history, and the outlook is generally regarded as favorable for the continuance of a large and steady run of business during the coming month. A goodly amount of repairs and overhauling is now in hand, which will call for a considerable volume of goods. Prices in general are very strong, with indications of further advances in certain lines. A feature of the trade is the pronounced scarcity which exists in a number of lines, especially Enameled Bathtubs and other Sanitary Enameled Ware, Sanitary Earthen Ware and certain sizes of Wrought Iron Pipe, in all of which lines of goods the manufacturers are away behind in their deliveries.

Plumbers' Brass Work.—The manufacturers of Plumbers' Brass Work who are members of the association withdrew prices on all kinds of Plumbers' Brass Work on Monday, July 29. A meeting was held on that date and prices were advanced 5 per cent. over those adopted on May 7. The goods affected include Stops, Stop and Waste Cocks and Bibbs of the Ground Key pattern, Compression Work of all kinds and sizes, all kinds of Fuller Work, and, in fact, all Brass Goods for water. It is said that the advance was brought about by the large demand for Brass Work for immediate shipment. An active demand has prevailed for several months past, and is likely to continue for the next three months. The condition of the Brass market has not been so favorable, from the manufacturers' point of view, in the past two and a half or three years as it is at the present time. Orders on hand with the manufacturers are said to be in such volume that it will be impossible for them to clean up their order books before the end of the year. All of the manufacturers have been complaining that for the past few years no money has been made in their business, and there seems to be a unanimity of opinion among the members of the association that they should insist upon having a fair profit on their product. There is a better feeling of confidence among the manufacturers at the present time than there was a short while ago. From what we can learn the advance made on last Monday will be the only one which will be insisted upon this year. One thing is pretty certain, and that is that prices on this class of goods will not be any lower for six months at least. The possibility is that if the Copper market changes and shows an advance Brass Work will show a like advance.

United States Radiator Company's List and Discounts.—United States Radiator Company, Dunkirk, N. Y., are issuing their quotations in the form shown below. Apart from the interest of the prices named, the way in which the convenience of the trade is served will be observed, the special feature of the price sheet being that in addition to showing the discount and the list price, the company have also figured out the net cost of Radiation per foot at the discount named and have printed it over the list. Thus, the list being 41 cents and the discount 55 and 2½ per cent., those using the list can see at a glance that the net is 17.99 cents, or practically 18 cents. This effort to simplify the work of the fitters will be appreciated. The discount sheet is as follows:

DIRECT RADIATION.

List Prices per Square Foot Heating Surface.

Hight in Inches.	45	44	38	32	26	23	20	18	Discount.
Chautauqua Two Column, Plain, Steam	.1799 .41		.1843 .42	.2018 .46	.2150 .49		.25 .57		55-2½

Triton Two Column, Water		.1896 .41	.1943 .42	.2127 .46	.2266 .49		.2636 .57		50-7½
Triton Three Column, Steam		.1799 .41	.1843 .42	.2018 .46	.2150 .49	.2325 .58	.25 .57	.2545 .58	55-2½
Triton Three Column, Water		.1845 .41	.1890 .42	.207 .46	.2205 .49	.2385 .53	.2565 .57	.2610 .58	55
Triton Four Column, Steam			.1890 .42						55
Triton Four Column, Water		.1845 .41	.1890 .42	.207 .46	.2205 .49	.2385 .53	.2565 .57	.2610 .58	55

The figures printed above the list prices, are the net prices, per foot, in cents, computed at these discounts.

INDIRECT RADIATION.	List Price.	Discount.
Perfect Pin, Steam or Water, 12 sq. feet per section	$3.24 per section. $1.95	40

An additional charge of one cent per foot will be made for assembling Indirect Radiation

SPECIALTIES.

Steam.	Water.	Discount.
Circular. 5[illegible] cents per section Curved .58 cents per section Corner. $3.80 per radiator Fitted for Marble Top. 85 cents per radiator Window .16 cents per section Stairway .34 cents per section Solid High Legs, 6 to 10 inches .53 cents per section	Circular .92 cents per section Curved .92 cents per section Corner $4.75 per radiator Fitted for Marble Top .85 cents per radiator Window .32 cents per section Cast Screen Tops (steam or water) 15 cents per section	25-5

OVENS.	List Price.	Discount.
Dining Room Ovens, made for Chautauqua and Triton Two Column Radiators only Size—Length of oven, 2 ft. 6½ in. Hight of oven, 17½ in. Depth of oven, 12½ in. Projection from rear face of radiation, 5½ in.	$35.00 per oven.	40-5

The above prices for specialties to be added to regular prices quoted for direct radiators.
All the above prices are F. O. B. our works Dunkirk, N. Y., less the carload rate of freight, not exceeding 15 cents per hundred pounds.
TERMS:—60 days or 1 per cent. Discount for cash within 15 days from date of invoice.
Our goods are guaranteed only to the extent of furnishing new sections for any found defective in manufacture.

Steel Clad Bathtubs.—The Steel Clad Bathtub market has been entirely cleaned up. None of the manufacturers of this class of goods carry any stock on hand. All of the Tubs that they are making are being shipped just as fast as they are finished. In fact, the scarcity of Steel Sheets is so marked that one of the Western manufacturers has issued a notice in which he announces that he has received two carloads of Steel Sheets for use in the manufacture of his Bathtubs, and that he is now in shape to execute orders promptly, and also that the delays heretofore experienced, owing to the lack of material, will be obviated while the present stock of Steel Sheets remains on hand. This notice is a good index of the condition of the market. Steel Clad Tubs are higher in price to-day than they have been at any time within the past three years, and with the resumption of work at the Steel mills a further advance in these goods seems to be unlikely.

Plumbers' Wood Work.—The supply of Plumbers' Wood Work is very far short of the demand. All of the wood working plants are three and four months behind with their orders, and orders which have been placed with the plants for carload shipments are being sent out in small, piecemeal shipments. This is done in order to help out the jobbers the best way possible. The demand for Wood Work comes chiefly from the out of town trade. While the city trade is picking up, it is still much behind what it should be at this season of the year. This is the season when many of the city folk are away from their homes, and when the mechanic takes possession of their houses in order to overhaul and renovate them, and at this time the demand from the city trade for all classes of Plumbing Material is generally very brisk. For some unexplained reason the season is, this year, several weeks behind.

Wire Nails.—The demand for Wire Nails in New York keeps up to former proportions. This somewhat exceeds expectations. Small lots from store are quoted at $2.60 per keg.

Cut Nails.—The Cut Nail market in New York is unchanged, small lots from store ruling at $2.18 to $2.25 per keg.

Wire.—The mills are having a heavy demand for Plain Wire from jobbers, and the latter report a good business from small buyers. The market is very strong. Plain Wire in small lots being quoted at 2.60 cents per pound and Galvanized at 3 cents.

Window Glass.—The combines have contemplated starting their Window Glass factories on September 15. It is now intimated that the time for beginning work is likely to depend largely upon the demand for Glass dur-

ing August. If it does not improve the starting of the factories may be deferred to give the jobbers an opportunity to dispose of stocks in hand. Jobbers' quotations for domestic Glass are unchanged, less than car lots from store being quoted at discount 80 and 20 per cent.

Linseed Oil.—The market remains firm, but purchases are usually limited to immediate requirements. The new crop of Flaxseed from the West and Southwest will probably be in the market about the middle of the month. This, however, is likely to be but a small portion of the entire crop and will supply the trade with Linseed Oil but for a limited time. The Northwestern crop of seed, it is understood, will not be in crushers' hands before the middle or last of November. It is estimated that the new crop of seed will be sufficient to supply domestic requirements. Plans are said to be on foot to further consolidate the Linseed Oil and White Lead interests. City Raw in lots of less than 5 barrels are quoted at 83 to 84 cents per gallon, Boiled Oil being 2 cents per gallon advance on Raw.

Old Rubber.—The market is quiet and prices are rather soft. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb	4¾c.
Rubber Shoes, less than carloads, per lb	7¾c.
White Wringer Rolls, per lb	7¾c.
Inside Bicycle Tubing, per lb	21 c.
Outside Tubing, per lb	7 c.

The Mackie Sheet Steel Tubing Works.

The Mackie Steel Tube Mfg. Company, Hammond, Ind., have built up within a very short period an important business in the manufacture of sheet steel tubing. It is hardly two years since they began to make brazed tubing on a small scale in Chicago. Their process proving a commercial as well as a mechanical success, they removed to Hammond last year, taking possession of a plant built for other purposes but adapted for the manufacture of their product. The property comprises 2 acres, which is well covered by buildings. At present the company are working into tubing over 25 tons of sheet steel daily, making a product ranging from ¼ inch to 2 inches in diameter. The tubing is made in any length, and of sheets of any thickness, from No. 12 to No. 30, as may be required. The company make both brazed and butted tubing, either plain or nickel plated, for umbrella manufacturers, bedstead makers, stove and range makers, implement manufacturers, &c.

The manufacture of brazed tubing of heavy gauge and in long lengths has been found an extremely difficult operation. In the halcyon days of the bicycle trade quite a number of establishments were successful in turning out short lengths of brazed tubing, made of thin sheets. This, however, was a very different matter from using No. 12 to 16 sheets and making tubing 15 feet or more in length. This is regularly done by the Mackie Steel Tube Mfg. Company, and they claim to be the only manufacturers in the country who have made a success of it. Their plant is so well equipped with special machinery that they are not only able to turn out any size or length desired, but can furnish tubing bent in any form. Metal bedsteads are now made in highly ornamental designs, with numerous scrolls and bends. The company receive sketches from the bedstead manufacturers and furnish tubing, accurately duplicating the pattern, without buckling or flattening.

For a great deal of work, as, for instance, metal bedsteads, sheet metal tubing has been found preferable to merchant pipe turned out by the makers of wrought pipe for gas and water. The latter is not only much heavier than necessary for such purposes, but the surface is rough, requiring much work in polishing for nickeling or enameling. Sheet steel, on the other hand, has a smooth and even a polished surface to begin with, and any gauge desired can be selected for the tubing, so as to make it quite light or fairly heavy. The brazing done by this company is accomplished by a process peculiar to themselves, making an invisible seam and a joint which is claimed to be permanent.

They have also their own process for beveling the edges of strips of sheet steel by which they are enabled to produce butted tubing with practically a lap joint.

The company are large manufacturers of umbrella rods, which are made of No. 22 sheet steel. The slots for the catches are stamped into the sheet, and a piece of steel wire is inserted for the tip, while it is being formed into a tube. Of these rods the company have a capacity of 780 dozen per day, enameled or nickeled, ready for use by the umbrella manufacturer.

Another product of these works is the Mackie bed caster, specially designed for metal bedsteads, made with a cork socket to cling to the inside of the tubular bed post.

The company have found the demand for their products running so much in excess of the capacity of their plant that they are considering its enlargement. The officers are as follows: Charles Mackie, president; Peter Thorsen, vice-president and superintendent; David G. Branckman, second vice-president; John A. Armbruster, secretary and treasurer. They maintain a city office and sample room at 166 Lake street, Chicago.

The North Star State Mfg. Company have been incorporated at Minneapolis, Minn., with a capital stock of $30,000, by George B. Leonard, H. A. Feltus and J. F. Gillick, for the purpose of manufacturing Self Heating Sad Irons.

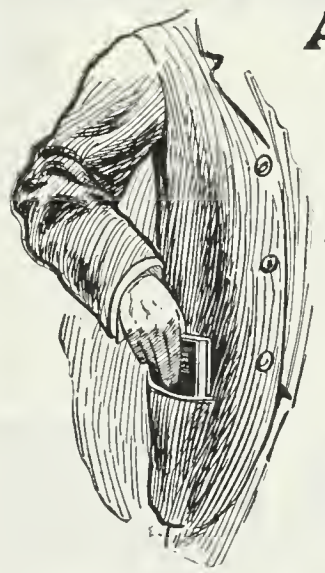
TINSMITHS' HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION



A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop.

An elementary manual for the young tinsmiths; A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, $1.00 Postpaid

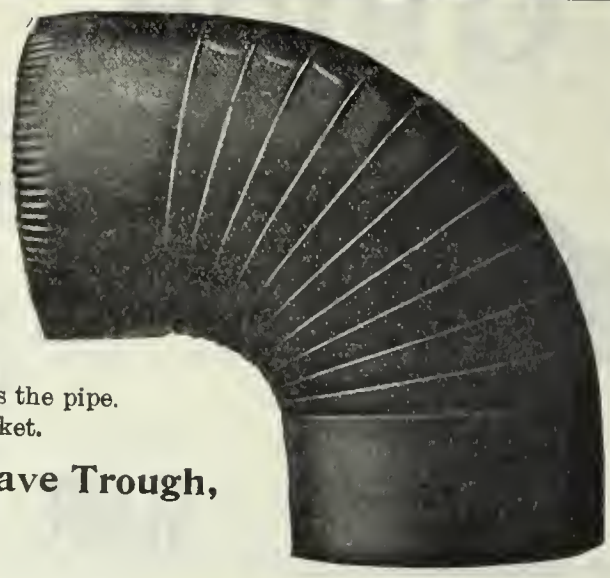
A Few Points About
The Dover Elbow:



No unsightly seams or corrugations standing out to give it a bunched appearance.
The outside can be polished, as it presents a smooth, even appearance.
The seams are folded on the inside.
No corrugations to reduce diameter and collect soot.
No seams to corrode and rust.
It is made on a scientific principle. It is the same diameter as the pipe.
It is handsome. It is strong. It is the best elbow on the market.

A Pleasant Dream.

The beauty of "BERGER'S Classik METAL CEILINGS" is something more than a pleasant dream—it is a pleasant reality.

Berger's "Classik" are the handsomest metal ceilings upon the market and are made in the greatest variety of patterns

They are correct and harmonious in design and appearance.

Our dies are reproduced from clay models.

Our stamping is sharp clear and well defined, and brings out the detail in bold relief.

Hence our material combines the artistic effect of plastic relief with the mechanical excellence of sheet metal.

Berger's "Classik" Metal Ceilings can be applied to either old or new rooms, and over plaster or wood

They make old rooms look like new and impart a handsome and lasting finish.

It will pay you to know all about them Drop us a line for full particulars.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

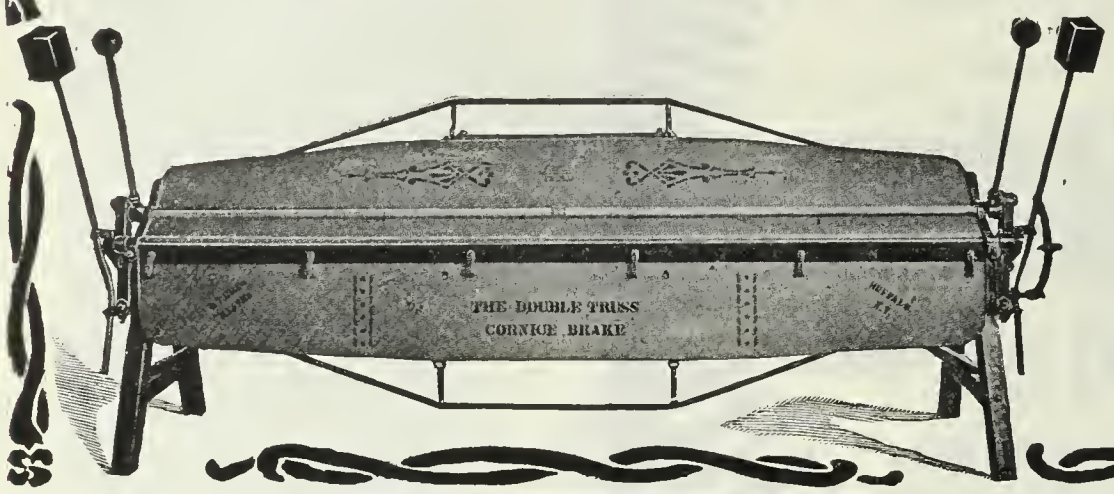
THE DOUBLE TRUSS CORNICE BRAKE.

This is the most practical brake on the market.
It is the most practical because, in the first place, it is lower in price than any other Cornice brake that will do perfect work.
Secondly, because its practical construction enables you to use it to the most profitable advantage.
When you hear about a good thing in your line of business, investigate it. Turn on it the light of reason and consider its money-making possibilities.



Let us send you information regarding our double edge on front leaf, for making fine members and corrugations.

The Double Truss Cornice Brake Co.,
1453 Niagara St.,

DOMESTIC ELECTRICAL WORK.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

BY WILLIAM A. WITTBECKER.

Price, in Paper, 25 Cents. Price, in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed.

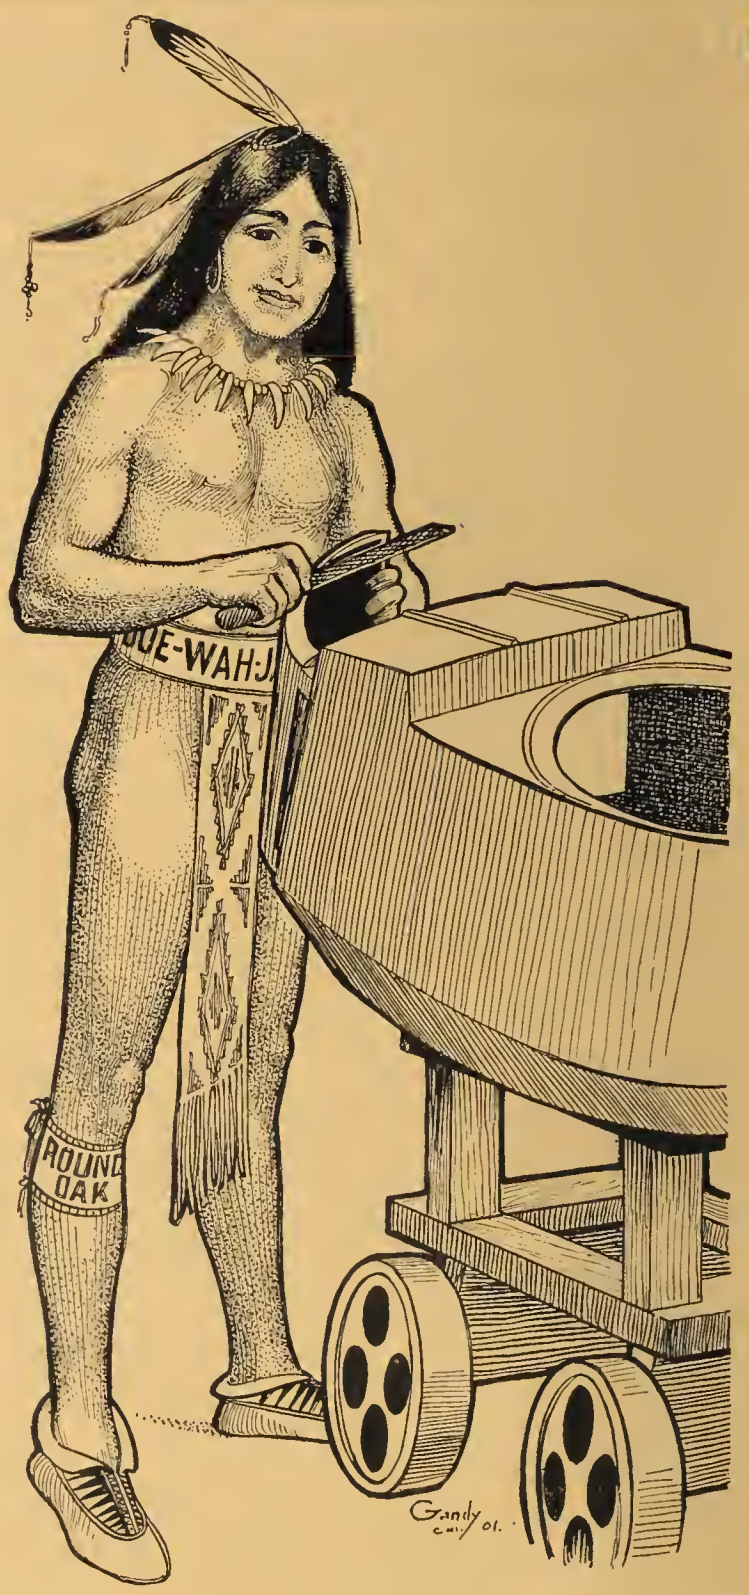
CVRTIS GANDY DEL CHICAGO 1901

The ash pit of the Round Oak furnace is cast in one piece.



The doors are ground on air tight. You could not stick a piece of tissue paper between the door and frame. It is air tight, smoke tight, gas tight, dust tight. It burns any kind of fuel. It is a furnace worth your while.

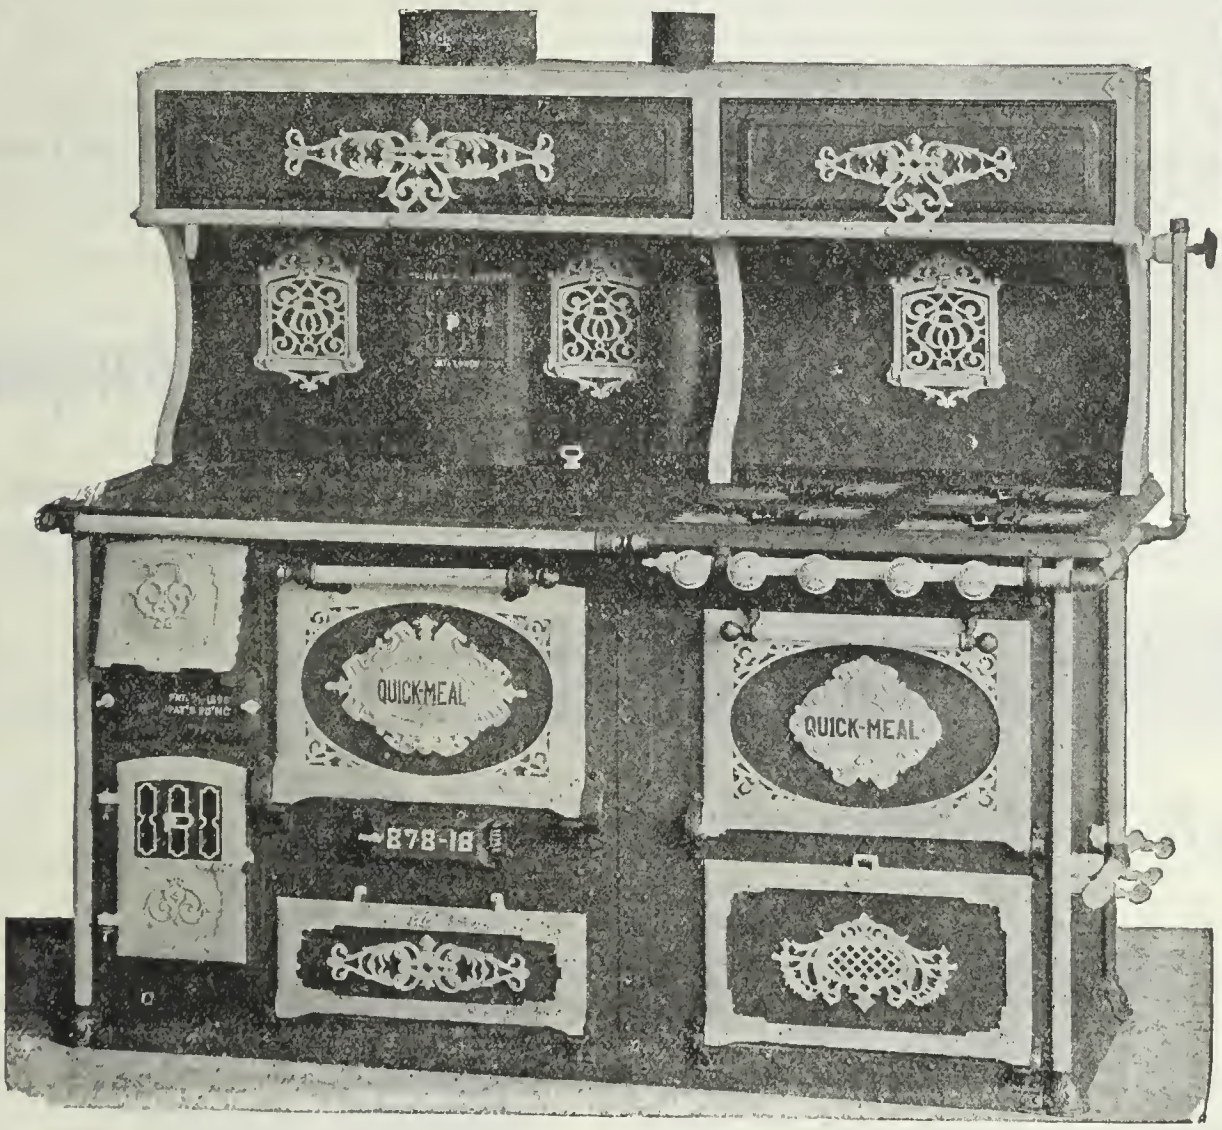
QUICK MEAL

Grand Combination Steel Range

FOR COAL AND GAS.



"Quick Meal" Grand Combination Steel Ranges are built to economize space and to meet the demand for a Range that can be used with comfort both summer and winter. They are so arranged that either the Coal or Gas Range can be used separately or together. The **Material, Finish** and **Design** is the **best,** and is everything that a **first-class Range requires.**

There is nothing as handsome and nothing as well made.

RINGEN STOVE Co. SAINT LOUIS

MONARCH CINDERELLA

FOR HARD COAL.

In the Monarch Cinderella will be found one of the most perfect high grade, medium priced, base burning double heaters offered to the trade.

Every modern and desirable improvement is embodied in its construction. We believe the careful buyer will acknowledge that there is not a better stove in its class.

Every point has been studied to make it the best; and for ingenious, effective simplicity in construction it stands without a peer.

Best Workmanship, Best Materials, Silver Nickel.

We would be pleased to send our catalogues.

Pittsburgh Stove & Range Company,

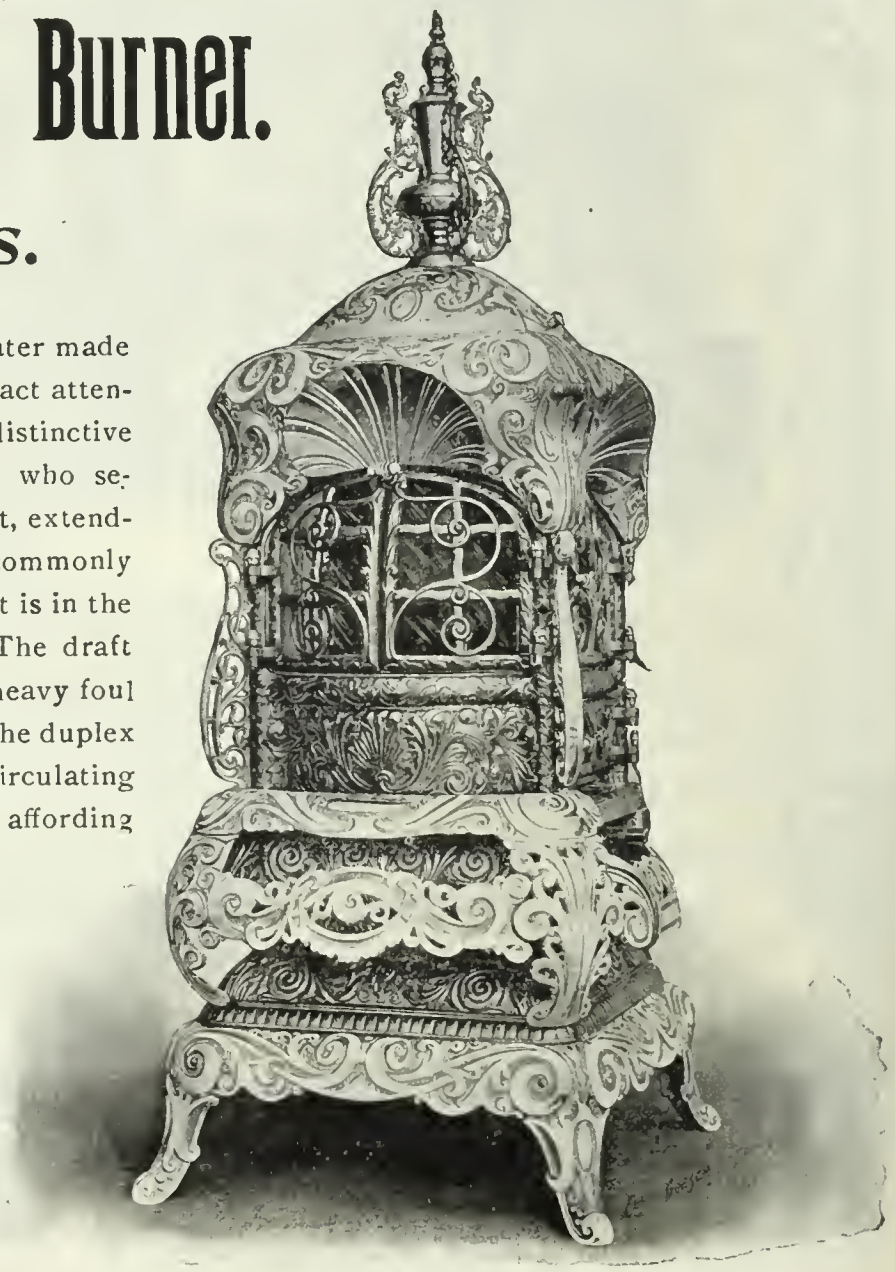
PITTSBURGH, PA.

WESTERN SALES AGENT, W. D. Sager, 38 and 40 Michigan St., Chicago, Ill.

The Monitor Base Burner.

High Art Series.

It is without doubt the most powerful heater made and its rich and graceful appearance will attract attention at once. The novel construction and distinctive features offer every advantage to the dealer who secures the agency. The diving flue is in front, extending entire width of stove, being what is commonly known as a sheet flue, thus the greatest heat is in the front of the stove where it is most needed. The draft is taken in through the bottom, carrying the heavy foul air which settles near the floor. Grate is of the duplex pattern with outer shaking ring. Two large circulating flues are fitted in rear corners of the stove, affording ample circulation for heating evenly the largest room. Send for new Catalog and secure the agency without delay.

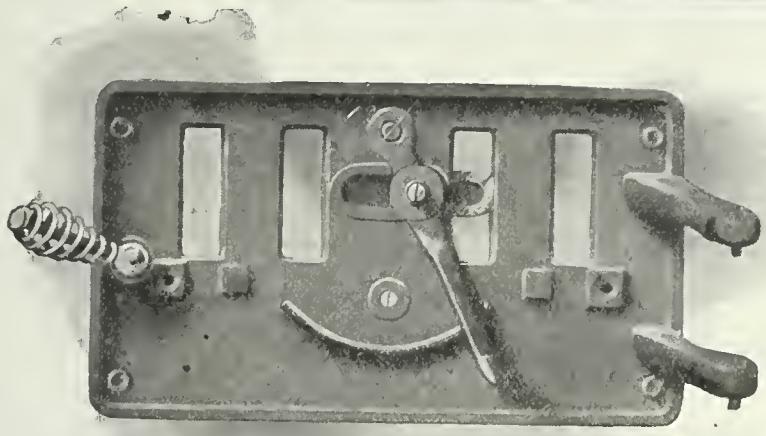


The Wm. Resor & Co.,

CINCINNATI, U. S. A.

Moore's Air-Tight Heater

The Air-Tightness of an Air-Tight Stove Consists in Its Being Air-Tight



The above simple fact is frequently lost sight of in the meaningless use of the word air-tight, loosely applied to many stoves regardless of the fit-ness of their joints. Much of the secret of the success of MOORE'S AIR-TIGHT HEATER lies in the perfection of the base door, all the joints being mechanically ground to within $\frac{1}{1000}$ of an inch of actual contact.

JOLIET STOVE WORKS

JOLIET, ILLINOIS

28

Model Oak

Entirely New Line for 1901.

We use the old name, but the numbers are different.

The Round Air Tight Register is ground into its seat on the inside of the ash pit door and will remain at any degree of opening required to supply air for combustion through the opening.

The register construction is such that the **Grate Handle** can be pulled out through the register opening

The Extension on Top of the Fire Pot extends up inside of the steel drum and is cast solid with the fire pot so it cannot twist and warp.

The Sectional Ring fits over the flange turned out on the bottom of the steel drum.

The Ash Pan fits tightly all around the edges of the ash pit.

The joints remain tight.

The price is just right.

Ask for more information.

PRACTICALLY A SMALL FURNACE.

Has no Equal as a Heater in Canada or the United States.

As Powerful a Heater as a Small Furnace, and Much More Economical.

Burns rough wood 30 inches long.

Flues the same as a modern expensive furnace.

Cold air can be drawn from adjoining rooms, or outside if desired, by connecting pipe to collar at back of stove.

Heat travels three times the length of stove before entering stove pipe. (See cut.)

Will heat a moderate-sized house as well as a furnace, and at less cost.

Is indispensable to country schoolhouses, where fresh warm air is so essential.

Handsome enough to be placed in any parlor.

IN CANADA.

We would like to have dealers in every Town and village press the sale of this stove, because, when one or two are placed in a district, it sells easily.

We will be pleased to furnish advertising matter **FREE.**

IN THE UNITED STATES.

Such a stove is not on the market, and if some **live, enterprising manufacturer** wants to monopolize its sale in that country, we are prepared to sell Duplicate Iron Patterns of same.

Complete information regarding cost of manufacture, prices for duplicate patterns, etc., cheerfully furnished.

AIR TIGHT HEATERS.

Our line in these comprises everything from the cheapest to the very finest finish possible to produce. Our manufacturing facilities and daily output justify us naming prices below any possible competition. This fact has enabled us to establish Wholesale Agencies in nearly every large city in the United States and makes it possible for us to supply the Dealer "Near His Door," saving time and freight. We also manufacture **Steel Ranges, Steel Cooks, Cast Ranges and Cooks, Hot Blast Coal Heaters, Oaks, Laundry Stoves, Radiators, etc**, all up-to-date goods.

Write us for particulars and we will put you in the way of making some money.

EXCELSIOR STOVE & MFG. CO., - Quincy, Ills.

THE

What Cheer Circulating Heater

Equivalent to a Furnace at a Fraction of the Cost.

Heats by circulating the hot air like a furnace. Will heat several rooms evenly. No cold corners. Takes up the cold air from the floor and heats it, leaving the floors warm.

Will do more and better heating with less fuel and less attention than other stoves.

SAVES ITS COST IN FUEL IN ONE SEASON.

Takes 28-inch wood. Keeps fire 48 hours. Is heavy, durable and tight.

We also make a very large, heavy circulating heater for Churches, School Rooms and Stores.

Highly commended by both dealers and users in all parts of the country.

Stock carried in our St. Paul Warehouse.

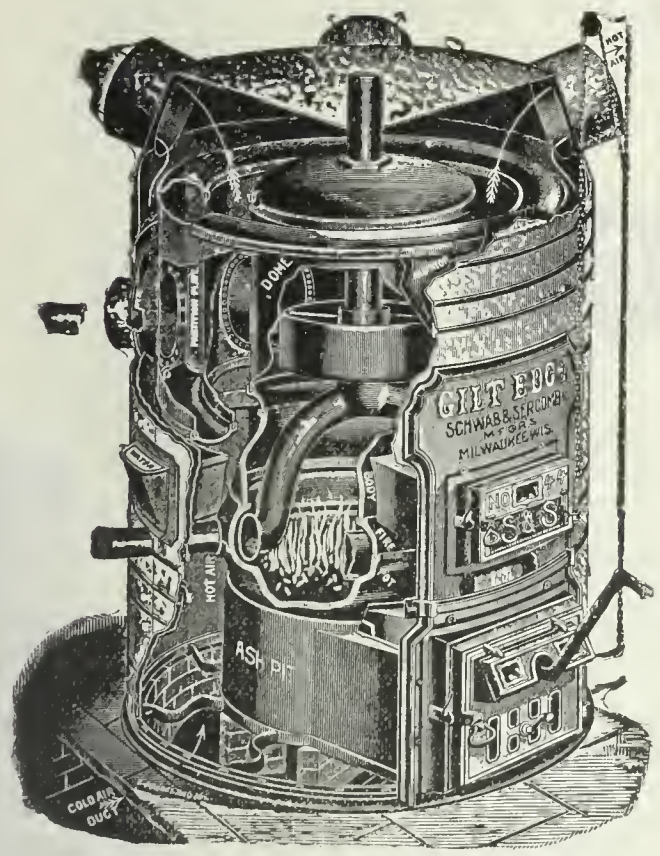
L. J. MUELLER FURNACE CO., 190 Reed Street, MILWAUKEE, WIS.

ANY DEALER who has ever sold the "DIGHTON" will tell you he has had less complaint than from an equal number of any other Furnaces he may have sold.

A 20-inch pot "DIGHTON" will do as much work as most other Furnaces having a 22-inch pot, and nine times out of ten your customer will say, "It requires less fuel than any other Furnace he has ever used."

If possible, set your first "DIGHTON" where some other Furnace has not done what it was intended to do. Don't use any larger size pot "DIGHTON" than what is in the old Furnace you remove, and guarantee better results with less fuel than the old one ever gave.

DIGHTON FURNACE CO., Taunton, Mass.



UTILIZED radiating surface, that is economy Sectional fire pots from 1 in. to 2 in. thick and other parts in proportion, that is durability. Positive gas-tight joints, that is necessary to health. These, with all other improvements for ease of management, are combined in the Gilt Edge Furnaces. They are made for all kinds of fuel, and are the very best.

"BRAINS"

"Profiting by the Brains of others without giving a fair return is a questionable way of making a living."

MR. DEALER:—In a clear and frank manner, we desire to bring to your notice the open infringement of our Drying Machines that are being exploited by certain reputable (?) concerns, and to ask you, pending the settlement of our claims by due process of law, to give to us the consideration we trust is due us as originators and patentees And while the law holds **that the trader in an infringed article is liable,** we are not going to "throw that into you," but we **are** going to ask **fair play** and we think you will give it.

We will state, however, incidentally, that we are going to make our infringing friends **sweat** for their audacity.

We make Dryers of any size and to fulfill any requirements; Dryers small enough to be placed in the smallest kitchen or laundry room, or large enough to fulfill the requirements of the most extensive institution.

We make machines heated by Laundry Stoves (as per cut), or machines heated by Hot Water—Steam—Gas—Electricity

We fulfill **any** specification, and, as we have two large factories situated in New York and Chicago, we are in a position to fulfill any order promptly and at lowest possible price.

We have a nice illustrated catalogue and would thank you to send for same. Let us hear from you.

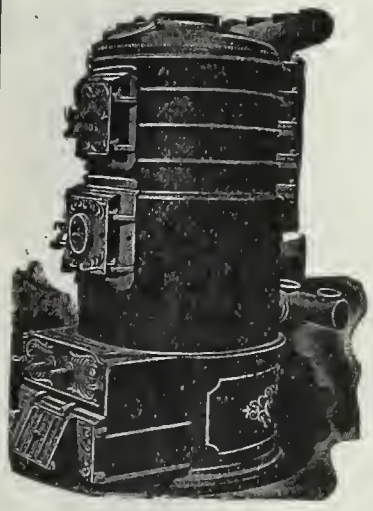
FOR EVERY SITUATION.



You know how it is. Many people can be satisfied with an ordinary heater. But now and then you run across a man who positively will not buy until he is thoroughly convinced that he is getting the best possible heater for the money.

Such a situation requires a

"GURNEY" HEATER,

because you can then assure him that it's impossible to buy any heater that is more durable, more efficient, or more economical to operate than the "Gurney."

And now: If the "Gurney" is good enough for such a situation it's the most desirable for every situation, especially ***since it costs no more than many of the less efficient heaters.*** Make it a practice to use the "Gurney" in all your work.

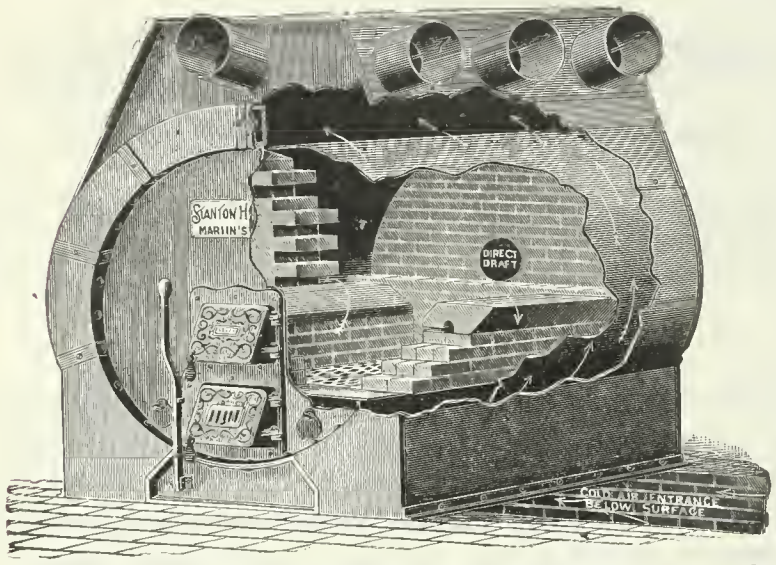
The Stanton Seamless Heater,

PORTABLE CASED.



STATE COLLEGE, PA., May 30th, 1901.

THE STANTON HEATER CO.,
MARTINS FERRY, OHIO.

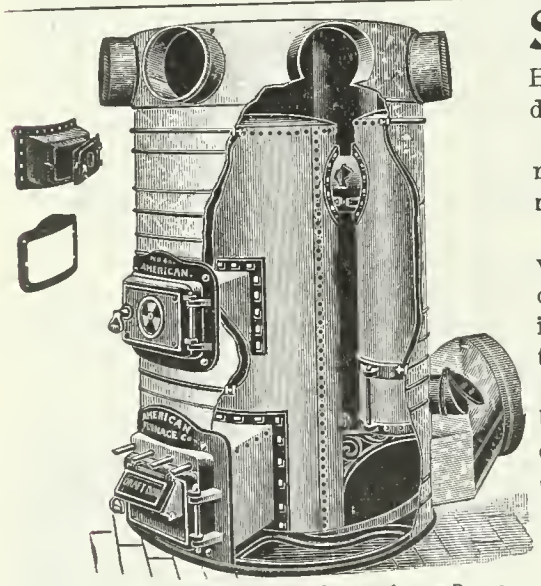
GENTLEMEN: We are very much pleased with the result of last season's work. We have sold and installed to date 43 Stanton Furnaces, and are pleased to state that every one of this number is satisfactory. We have come in contact with all kinds of conditions and buildings that parties could not heat with the various different makes of sectional cast iron Furnaces. These conditions have all been met with the Stanton Furnace full and adequate, and every Stanton Furnace will warrant the highest testimonial as to its merits. We realize that the Stanton Furnace is the best warm-air Furnace in existence at the present time, as all manufactured articles are judged from their natural product of the past, and we must credit them according to the service which they have rendered to the users.

We did not make any special effort to sell the Stanton Furnace, as this was our first season on it and we wanted to learn just what could be done with the Stanton, and whether it would prove itself superior to all other Furnaces as per your statement. We are now able to corroborate the statements and bold assertions made to us by your general salesman, Mr. P. E. Cash, at the beginning of the Furnace year, July 17th, 1900. He did not overrate the Furnace as we believed he had at the time he started us on the Stanton Furnace. We are now satisfied that we made no mistake by representing the Stanton Furnace to the general wants of the public, knowing that we are selling an article that is unlike anything of the kind on the market, and a device that is not in competition with the sectional cast iron Furnaces.

Yours truly,
J. N. & S. KRUMRINE.

This is the type of Furnace installed in the Glessner residence and illustrated in this issue of *The Metal Worker*. Send for Catalogue of the Best Heating Furnace on the Market.

THE STANTON HEATER COMPANY, Martins Ferry, Ohio.



Burn Hard or Soft Coal, or Coke. Large Doors.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The ***American Furnace*** is made for the better class of trade; is durable, clean and economical in fuel.

The Kelsey Warm Air Generator

SEE OUR EXHIBIT AT THE PAN-AMERICAN EXPOSITION.

World's Columbian Exposition, Chicago, 1893, Award, With Medals.

For a new and original, and very efficient form of Warm Air Heater, in which heavy cast iron sections, with corrugated sides, through which is circulated the fresh air, form the fire box and combustion chamber, and are exposed on all sides and throughout their length to the fire and hot gases, thus exposing an exceptionally large surface to the fire.

For the means whereby the warm air may be directed in separate and independent channels, and distributed in such proportions as to insure uniformity of heating in different parts of a building.

Brilliant Enameled Steel Ware

This ware is now manufactured by our factory at Bellaire in the Brown Color only, same having been discontinued in all colors by our Portland, Conn. factory. Particular effort is being made to turn out a highly satisfactory and pleasing article, and all dealers are requested to order a sample lot to be convinced of the merit of this ware.

White and White Enameled Steel Ware

This ware will also be made by our Bellaire Factory only hereafter having been discontinued by the Portland Factory. A large line of hospital goods made in this ware Recommended where sanitary qualities are essential.

Shorter Credits in the Stove Business.

Manufacturers who are using sheet steel and other products of the great consolidations have been initiated, quietly but firmly, in the ethics of prompt payment for their purchases. While it seemed a rather drastic proceeding, an excellent object lesson on business practices has thus been furnished. All who sell goods would welcome similar promptness, but are not always in a position to enforce it. The stove manufacturers have been working for a long time to shorten credits and obtain quick returns, although there has been some diversity of opinion among them on the subject. While none of them would object to short time and prompt payments, it has been a question as to what would be satisfactory to their customers. The consolidations, however, have emphasized the fact that ten days means ten days and no more, and that payment must be made at their expiration. Previous to the inauguration of the present condition of things the stove manufacturers received their invoices with terms marked in the usual manner, and after the goods had come to hand and invoices had been checked, settlement was made in the regular course of business, and sometimes in a leisurely way. As soon as the new managers took control of the steel industries they demanded a settlement to the minute and would brook no excuses. That the house had been a good customer and was absolutely solvent, and, moreover, indignant and surprised at such peremptory demands, counted for nothing. The bills must be paid on time. This decisive manner of doing business caused some ill feeling and called out acrimonious correspondence. Such complaints were met in a very courteous and explanatory manner, but nothing was conceded in abatement of the terms of payment. The recitation of these facts is not for the purpose of criticism, for there is, indeed, much that is desirable in the new state of affairs, but to bring up the question of shorter credits in the stove trade. The steel makers have done what every business man would do if he could. There is no question as to the desirability of prompt payments. In this case the stove manufacturers have conformed to the terms imposed upon them, and their customers should do the same. There is no doubt that laxity in the matter of payment is a detriment to the trade. Much is to be said in favor of shorter terms and the advantages that would result therefrom to both the producers and distributers of goods. The stove dealer is not as exact in his business methods or as prompt in his collections as the welfare of his business requires. A reform in these regards would tend to promote his success. The stove manufacturers will be advancing the welfare of the trade in pushing patiently and earnestly in the direction of shorter terms. The recommendation of the National Association that goods be sold on sixty days instead of the former terms of four months was an important step in the right direction. It would be a matter for congratulation if the rule were lived up to by manufacturers and merchants. There should be cooperation between the manufacturers and the dealers in securing this end. Merchants, large and small, should welcome any efforts to bring about a better condition in this regard, recognizing the fact that in this way the tone of the trade will be improved and a basis laid for a larger and more profitable business.

Furnace Heating with Natural Gas.

Wherever natural gas has been adopted as fuel the satisfaction with the results obtained has been only secondary to that derived from the avoidance of labor and dirt which accompanies its use. In no field are these benefits more apparent than in house heating, and particularly where the gas is used in hot air furnaces. Not only is the care of the fire reduced to a minimum, but the steady temperature maintained by a gas fire in a furnace secures a constant inflow of pure warm air, maintaining a comfortable atmosphere in the house. That special features would be attached to the installation of a heating system of this character is natural, which lends interest to the presentation in another part of this issue of a description of a furnace system using natural gas for fuel. It will be noted in this case that a large volume of warm air is provided and also that the natural gas lends itself admirably to the ventilation of the building, being applied so that its heat is directly used for effecting exhaust currents to remove the fouled air from the various rooms. Since its discovery natural gas as a fuel has been used in all kinds of heating apparatus, and has given general satisfaction. It is gratifying to note that the experience in this line has led to substantial improvement in furnaces burning natural gas as fuel, and to the modification of the best practice in furnace work to suit the special requirements of the case.

Packing Goods for Export.

The importance of the careful packing of goods for export has been referred to in these columns on several occasions, and a number of our consular officers at various times have brought the matter to the attention of American exporters in their reports to the State Department. The latest communication received in this connection is that of Charles Neuer, United States Consular Agent at Gera, Germany, who complains that American manufactured goods do not receive the favor that their merits deserve by reason of the unsystematic and careless methods used in packing them for shipment abroad. In most European countries special attention is given to packing, as no matter how excellent the goods they are bound to lose in value if badly put

up. European manufacturers lay great stress upon the durability and neatness of their packages, and old boxes or other coverings are never used. In making shipments to Europe American exporters should wrap their goods so as to exclude moisture, and pack them in strong wooden cases nailed with wire nails and strapped with steel bands. Economy of space is also an important consideration. Special care should be taken to wrap articles of cast iron so as to avoid shifting. On account of careless packing goods of this class frequently arrive at their foreign destination either broken or rusty. Care is also necessary in driving nails, it often having been found that nails have penetrated and damaged the contents of the cases. Mr. Neuer says he has found that, considering the distance goods are transported and the amount of handling they are calculated to receive, the American packing is often sadly inadequate. As an illustration of this, he cites the case of a large number of American stoves which were ordered by a German merchant. Upon their arrival several of them were found to be badly broken, and many of the smaller fittings, such as screws, knobs, &c., were missing. The stoves were packed in crates weighing over 400 pounds, which made careful handling impossible. The fittings, including heavy lids, were put inside the ovens loose, and shifted noisily about whenever the crates were moved. As a consequence all further orders to this particular house were canceled. It is unfortunate that American manufacturers and exporters still give cause for complaint in regard to their careless methods of packing. There is no doubt that due attention to this feature would tend to materially increase our export trade. It is conceded everywhere that American manufactured goods are as good as, if not better than, those of other countries, and it is only necessary to correct these minor faults to render their position in the markets of the world unassailable.

The figures published by the Post Office Department covering issues of stamped paper during the fiscal year ended June 30, 1901, furnish very convincing testimony of the increased activity of business during the past 12 months, as compared with former years. The total number of pieces of stamped paper issued during the last fiscal year, including postage stamps, stamped envelopes, newspaper wrappers and postal cards, was 5,705,731,709, representing a money value of $104,785,986, an increase over the previous fiscal year of $7,098,215 and over the fiscal year 1899 of more than $12,000,000. Taking these figures as a basis, there seems every warrant for the statement that the past 12 months formed the most prosperous business year in the history of the country.

Nothing can give a more adequate idea of the immense advance in wealth and population that New York City has made since the early part of the last century than the remarkable difference in the values of real estate in the lower part of Manhattan Island 80 or 90 years ago and now. *Leslie's Weekly* quotes some figures in this connection which are of interest. For example, the Boreel property on lower Broadway, which was recently sold for $2,500,000, changed hands in 1815 at a valuation of $10,000, and other buildings in the same neighborhood, then assessed at a valuation of $16,000, $6000 and $8000, are now rated at $1,700,000, $850,000 and $350,000, respectively, showing increases in some cases of more than a hundredfold in valuc.

The Contractors' and Manufacturers' Protective League has been organized in St. Louis, Mo., with the object of doing away with sympathetic strikes in the city. There has been more or less friction between contractors and the Building Trades Council of St. Louis, and the feeling has been growing that the time has arrived to take some action to prevent strikes, especially during the World's Fair period and subsequently. The league embraces in its membership the local master builders' association, iron and lumber interests, the Building Contractors' Association, master bricklayers, stone masons, and a majority of the building materials men. The league is composed of substantial men, said to be thoroughly in sympathy with unionism, but opposed to the practices employed by the Building Trades Council and its agents in St. Louis for the past two years.

Now that the drought in the corn States has been effectually broken by copious rains, it is found that the early estimates of failure and excessive damage to the crop were largely exaggerated. That severe damage was done to the corn by lack of rain and extreme heat last month must be admitted, and the late rain came only just in time to save the farmers from very heavy losses. But the situation, it appears, was never quite so desperate as the alarmists would have made it. Moreover, the falling off in the volume of the corn yield will be largely compensated for by the increased value of the cereal. The wheat crop is very large, and, taking everything into consideration, the farming interests are not likely to suffer to any serious extent this year. The outlook for the crops is now brighter than it has been for many weeks past.

It frequently has been assumed that the high level of last year's phenomenal commercial operations could not be repeated this year. Reports on the volume of trade for the six months ending June 30, 1901, do not bear out this prediction. Figures gathered by the Treasury Bureau of Statistics on the movements of internal commerce for the first half of 1901 show that as a rule the contrary is true and that the tide of commercial prosperity is still on the upward trend. Wheat receipts, for example, at eight leading markets aggregated 217,159,743 bushels for the season to June 30, 1901, compared with 209,972,915 bushels for the season to June 30, 1900. The yearly receipts of live stock at five Western markets to June 30, 1901, were 2,969,566 cattle, 9,120,790 hogs and 3,269,537 sheep. This exceeds by 344,552 head the arrivals for the corresponding period of last year. Traffic receipts of live stock at Chicago alone were 4208 cars above those of the first six months of 1900, and shipments were greater by 3786 cars. Lake receipts have exceeded those of last season in the quantity of flour, coal, lumber, logs and unclassed freight handled. The shipments of grain for the six months since January 1 reached a total of 50,559,011 bushels, being a million and a half bushels ahead of last year's record for the corresponding six months. This illustrates the extent to which transportation interests have been sharing in the prosperity of the country this year.

The British House of Lords this week rendered an important judgment affecting trades unions. The case was brought up on appeal from the judgment of the Irish courts awarding a wholesale butcher damage against the Butchers' Assistants' Association, which brought pressure to bear on retailers to boycott the plaintiff until he dismissed a certain nonunion employee, threatening, otherwise, to call out the union employees of the firms concerned, and, finally, it induced the nonunionist to leave the plaintiff. The Lords dismissed the appeal, on the ground that the acts of wrongful and malicious conspiracy were not undertaken to advance the interests of the workmen themselves, but solely to injure the plaintiff.

The Hamburg-American Line is reported to have signed a contract with Harland & Wolff of Belfast, Ireland, for the construction of a 21,000-ton steamer. Although larger than the "Deutschland," the new liner will not be built for speed, and, therefore, is not calculated to compete in that respect with the transatlantic champion.

THE WESTERN STOVE TRADE.

It is interesting to note that the great drought in the West has had, thus far, no marked effect on the demand for stoves and ranges. Manufacturers whose trade covers the entire West, including specially afflicted districts, and who had booked numerous advance orders during the spring months, report that cancellations are much fewer than they had expected. They are now passing through a critical period, because of the apprehension over the drought, and it is extremely encouraging to find that the trade is not encountering seriously adverse conditions.

It is expected that the fall trade this year will be much larger than that of last year. It will be remembered that July, August and September of last year were exceedingly dull months. This was due to several causes. In the first place the trade had placed heavy orders in the early spring, anticipating an advance in prices. Next, general business was badly checked by the great break in wire nails, which occurred in the latter part of April and completely upset all confidence in values of hardware and necessarily affected the stove trade. Buyers from that time looked forward to a slump in stove prices. They waited through the summer months and at last were compelled to make purchases in October and November. The November business proved to be the heaviest for that month ever known.

This year no overbuying occurred during the early months. Trade has proceeded on a normal basis without any particular disturbance, or special development, but has been governed entirely by the supply and demand. This has brought the trade into the regular buying months in fair condition. July proved to be a month of exceedingly good business, and thus far in August the sales are running very much in excess of the corresponding period of last year. Now that the drought has been broken and the first estimates of the damage to crops have been found excessive, manufacturers are strongly inclined to believe that the buying of stoves will be of the average seasonable character, if not somewhat better. Consequently they are looking forward to a good stove year.

Prices are being well maintained, and in view of the scarcity of steel no temptation exists to cut them. The leading manufacturers of steel ranges and other steel goods are believed to be fairly supplied with stock thus far, it being only the smaller manufacturers who have found themselves seriously inconvenienced by the strike in the steel sheet mills. If the strike continues for any length of time it is possible that the shortage may be felt by the entire trade. If this occurs it will be very difficult to secure such goods and prices may advance. Even cast goods are not free from the possibility of being affected on this account, as few constructions are now turned out into which sheet steel does not enter to a greater or less extent.

What Cheer Circulating Wood Heaters.

The What Cheer Stove Company, St. Anthony Park, St. Paul, Minn., have favored us with a copy of the sixth annual catalogue of their circulating wood heaters. The What Cheer heater is specially adapted to the use of wood and heats a room on the same principle as a hot air furnace—namely, by the circulation of the heated air through the room. The heater, in general appearance, resembles a Todd stove, but has an outer casing, perforated at the top and bottom, so placed as to leave an ample air space between it and the stove body. The cold air thus enters the lower perforations and, being heated by coming in contact with the stove body, passes out through the upper opening, thus causing a rapid circulation of warm air to all parts of the room. The stove body is constructed of heavy steel plates, which are good conductors of heat and at the same time very durable. The casing is constructed of Russia iron, which makes a very attractive finish. The draft opening in the feed door is so arranged that the air passes through a hollow space and is heated before it reaches the fire, thus making a hot blast draft, which secures more perfect combustion of the fuel and consequently greater heat.

The catalogue illustrates a variety of patterns, comprising highly ornamented stoves for parlor use, plainer stoves for ordinary domestic purposes and large heavy stoves for heating offices, school rooms, stores, &c. The catalogue also contains a number of testimonials from persons who have used these heaters and have found them very satisfactory in operation.

Riverside Stoves and Heaters.

The catalogue of 138 pages which has just been issued from the press by the Rock Island Stove Company of Rock Island, Ill., is an attractive publication, profusely illustrated and bound in colored paper covers. The work is intended to cover the season of 1901-1902, and in its early pages are to be found announcements regarding terms, shipments, samples, weights and measurements, a telegraphic code, and a view of the Riverside steel range, dismantled, showing the essential parts of which it is constructed. In referring to this range the company state that they have taken great care to make it heavy and substantial, attention being particularly called to the fire box and the top of the stove, which is claimed to be new on steel ranges. Another feature is the peculiarly "nibbed" oven bottom, reproduced in heavy steel and guaranteed not to warp. The range is made for burning soft coal, hard coal or wood, and is offered in a number of styles and sizes, several of which are illustrated. The Island City Steel Range is an attractive construction, of low cost, embodying features which render it satisfactory in operation. What the manufacturers refer to as "the best low priced steel range on the market" is the New Riverside, which has corrugated oven bottom, pouch feed with register, duplex grate which by reversing can be used for wood, steel body well braced, and linings of asbestos. Many other members of the Riverside family are presented, including the wood Riverside range, intended for burning wood, cobs, &c., as fuel. Following the ranges, attention is given to cook stoves, of which a variety are presented. The leading base burner is offered under the name Riverside, and is a very handsome construction. Other goods include the Maple Riverside, an attractive base heater for wood only; the New Riverside Oak, with and without ventiduct, and the Island City Hot Blast. The closing pages of the catalogue are devoted to the subject of repairs, tables being presented giving the weights of pieces usually called for as repairs to the stoves made by the company; a list of pieces fitting more than one stove, together with lists of interchangeable wood linings, water fronts and backs, reservoirs, &c., followed by directions for operating stoves, and a miscellaneous assortment of advertising cuts.

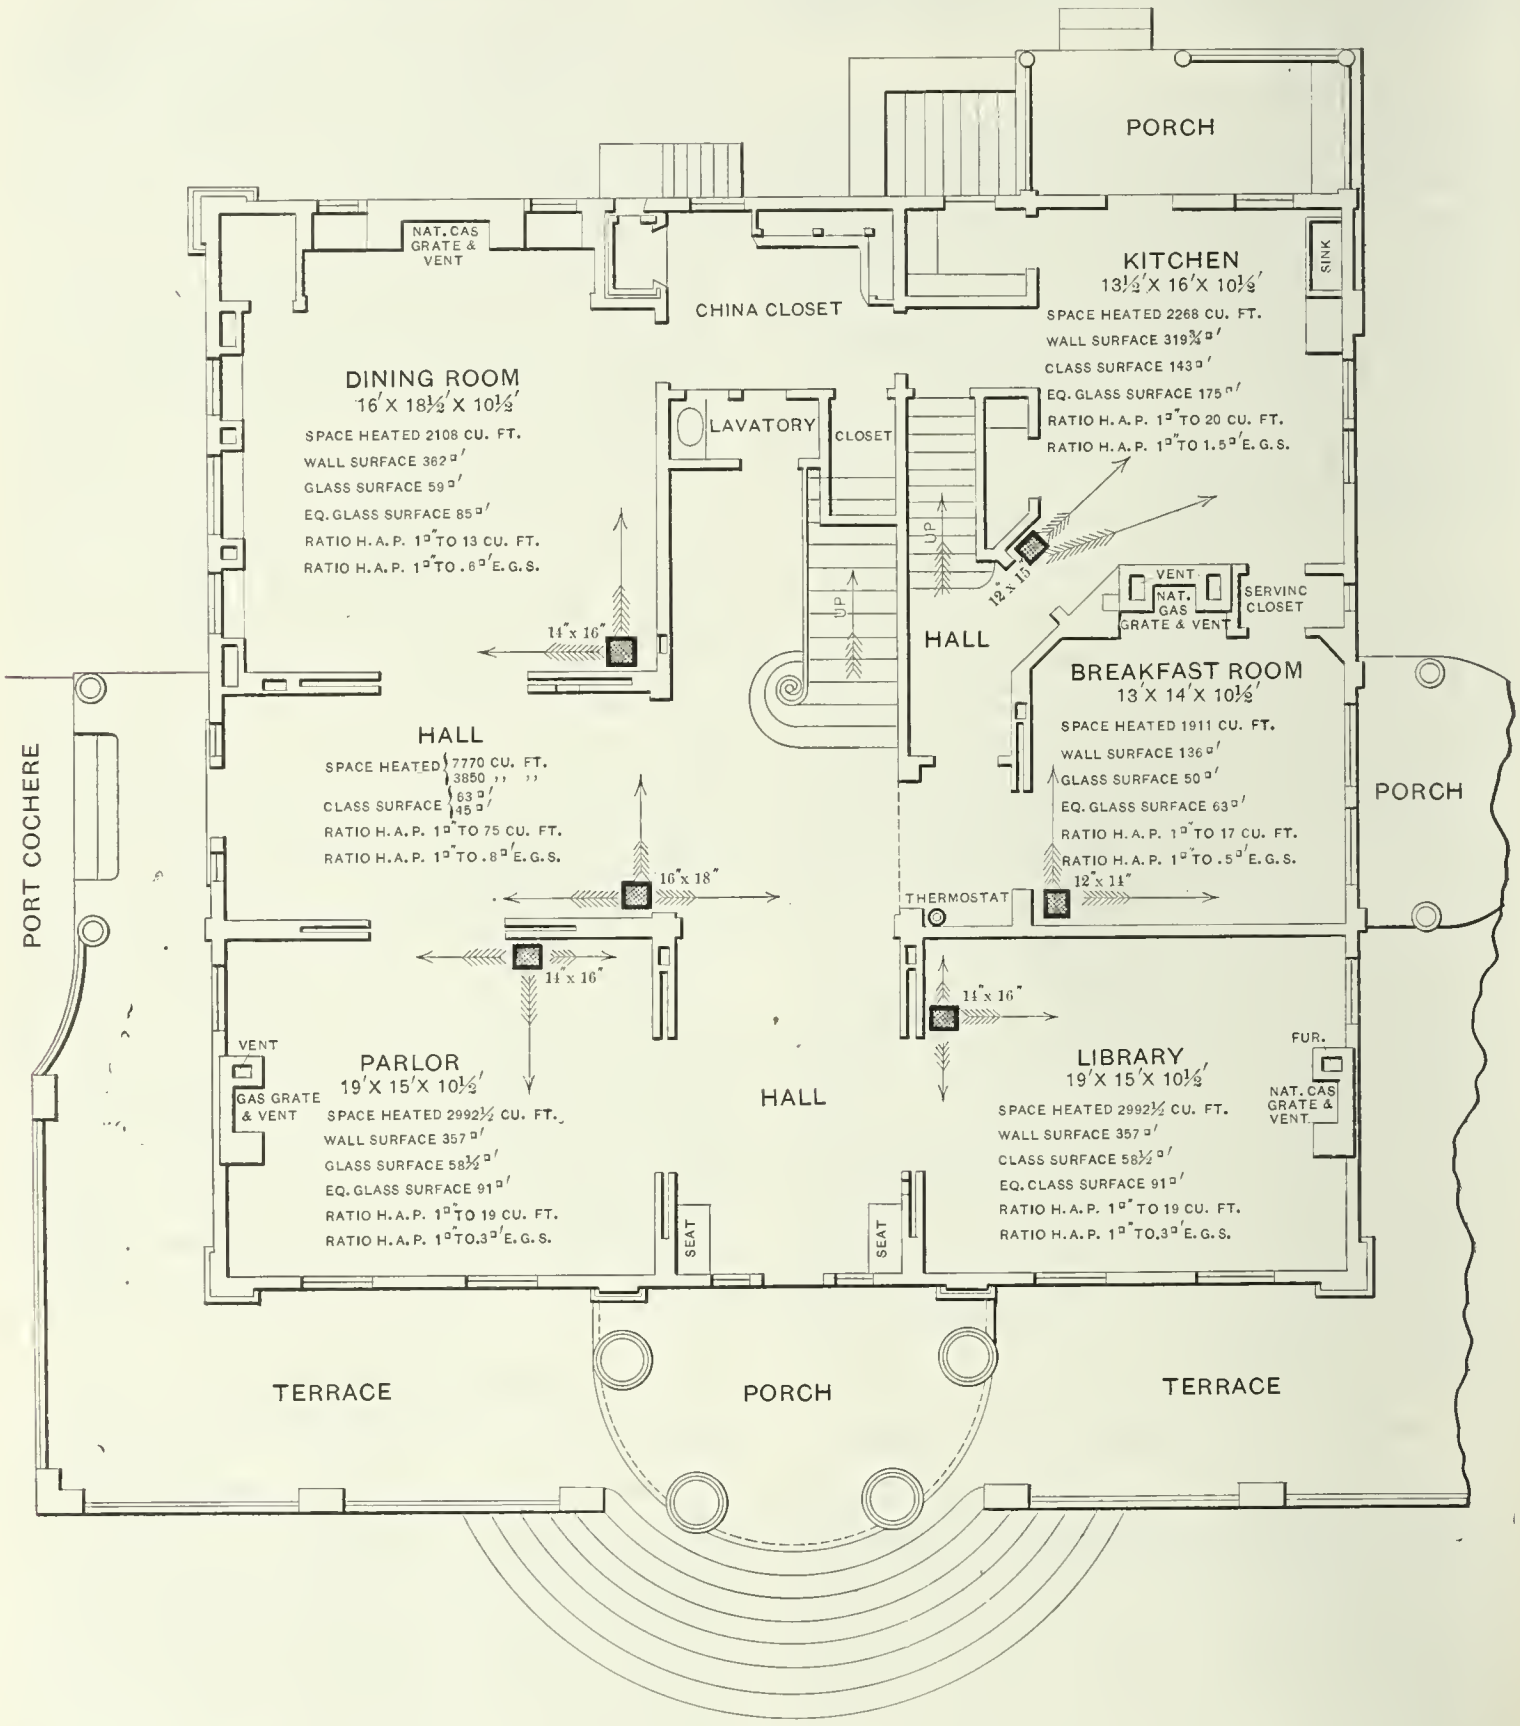
Etna Hot Air Furnace.

The Pittsburgh Stove & Range Company, Pittsburgh, Pa., are sending out a handsomely printed catalogue of 20 pages in a pink cover, bearing a design in yellow and black, devoted to their new Etna hot air furnace. In building this furnace the company state that they are contributing their quota toward the betterment of heating appliances and do not desire it classed with many cheaply constructed, low priced furnaces, but recommend the Etna as a high grade furnace. Among its special features are a deep, strong ash pit, an easily removed labor saving grate, a sectional fire pot, an air blast and a combustion chamber and radiator of either steel or cast iron, arranged to effect an indirect draft and to expose a large surface. Both the fire pot and the cast iron radiator have greatly increased heating surface by the use of extending wings.

MAST & CLASS, 643 Massachusetts avenue, Indianapolis, Ind., agents for the International Heater Company of Utica, N. Y., inform us that in order to enlarge their office and showroom they have leased a two-story building in the rear of their present premises. In it they will carry a complete line of Economy Furnaces and establish their tin and sheet metal working shop.

A Furnace System Using Natural Gas.

The fact that natural gas when burned in a hot air furnace does not subject it to the heating and cooling due to the replenishing of a coal fire with fresh fuel, but instead maintains a steady temperature at all times, will lend interest to the following description of such a heating system. The residence of William L. Glessner, president of the Laughlin Nail Company, Wheeling, W. Va., stands on a knoll commanding a fine view at Pleasant Valley, a suburb of that city. The building is of substantial construction and was erected from plans made by Edward B. Franzheim, an architect of Wheeling. The heating system was installed by the Stanton Heater Company of Martin's Ferry, Ohio, a No. 84 Stanton seamless warm air heater of the portable type, incased in galvanized steel, being used. The work for the heater may be understood from the plans of the first, second and third floors, shown in Figs. 1, 2 and 3, on which are given the space heated, wall, glass and equivalent glass surface, and the proportion existing between the area of hot air pipes and the work done. Fig. 4 is a plan of the basement, showing the location of the heater and the size of the hot air pipes leading



A Furnace System Using Natural Gas.—Fig. 1.—Plan of First Floor.

to the different rooms. The size of the hot air pipes, when considered in connection with the size of the rooms which they heat, will show that the system is intended to furnish warm rather than hot air, and it is said that the air is not delivered into the rooms at a temperature above 140 degrees. There are 14 hot air pipes, having a combined area of 1406 square inches.

THE COLD AIR SUPPLY AND FILTER.

An interesting feature of the plant is the method of supplying cold air. An opening on the west side of the

building is provided with a screen and damper, the screen to prevent the entrance of animals, leaves and other foreign matter, and the damper to shut off the outside air supply in case of heavy winds. From this screen a duct leads to a window which has an opening with an area of 1400 square inches. This window opens into a filter room, 6 x 10 feet in size and 8 feet in hight. Placed diagonally across this room is a cheese cloth filter screen, exposing 10 square feet of surface for every square foot of area in the duct supplying fresh air to the furnace. A door is placed in this filter room so that cold air can be taken from the basement when the wind from outside is too strong. This door also allows the filter screen to be removed and washed when the particles of dirt so fill the meshes of the cloth as to interfere with the proper flow of air. The cloth screen is fastened to a margin of stouter cloth, provided with eyelets for securing it to screw hooks. By this means it is only necessary to provide two filter cloths, and yet always have one fresh laundered and clean when it is necessary to remove the one that has become filled with dirt. The time that a filter screen will render service without cleaning depends principally on the weather. After a rain, when the atmosphere is clean, a filter may serve for several days, while on the other hand, in dry weather, when the atmosphere is filled with dust, the cloth will soon become so filled as to require a change. The duct leading from the filter room under the ground to the furnace is made of brick laid in cement mortar, so as to prevent it from being flooded from outside. Its large size gives ample opportunity for it to be readily cleaned and given a fresh coat of whitewash every fall.

NATURAL GAS FUEL.

A great convenience is the use of natural gas for fuel, thus avoiding the dirt incident to the putting of coal into the cellar, removing the ashes and attending to the fire. Besides it has the advantage of a steady, even temperature in the furnace throughout the whole 24 hours. The burner is of the mutiple Bunsen type, 18 burners being connected to three ¾-inch pipes adapted to supply gas to the burners through a mixing chamber. These three pipes are all connected together at the point of supply, on which there is, in addition to the regular stop cock, a Langsenkamp thermostat and a by pass for the pilot light. The burners are placed in three rows of six each, at a distance of 9 inches apart each way. The top of the burners is 37½ inches from the top of the combustion chamber, and they burn with a flame 4½ inches in hight, which spreads so as to fill the fire box with one continuous sheet of intensely hot flame.

LOGGIA

Fig. 2.—Plan of Second Floor.

The thermostat, made by Langsenkamp Brothers, Indianapolis, Ind., is so arranged as to shut off the gas supply when the temperature in the house rises above 70 degrees and turn it on again when the temperature falls below 70 degrees. In use it has demonstrated its efficiency by maintaining a temperature that has not varied throughout the season more than 2 degrees. The

pilot light is kept burning continuously to light the burners after the supply has been cut off from them by the thermostat and is turned on again.

THE COST OF FUEL.

The cost of gas in that vicinity is 20 cents per 1000 cubic feet, and the average cost of gas for keeping an even temperature in the building has been about $16 per month throughout the season, which compares very favorably with what hard coal would cost for heating such a building. Moreover, by the use of natural gas and a thermostat all the labor and care of attending the fire is avoided. Taking $16 a month as the average cost for heating, the cost of fuel is 53 cents per day, and at 20 cents per 1000 for gas this would make a consumption of a little over 2500 feet for 24 hours, or 100 feet per hour. It may naturally be inferred that on the coldest days of the winter a larger quantity of gas is burned, while in the milder months of the fall and spring a much less quantity is used. In fact, it is stated that on some days less than 1400 feet of gas was burned.

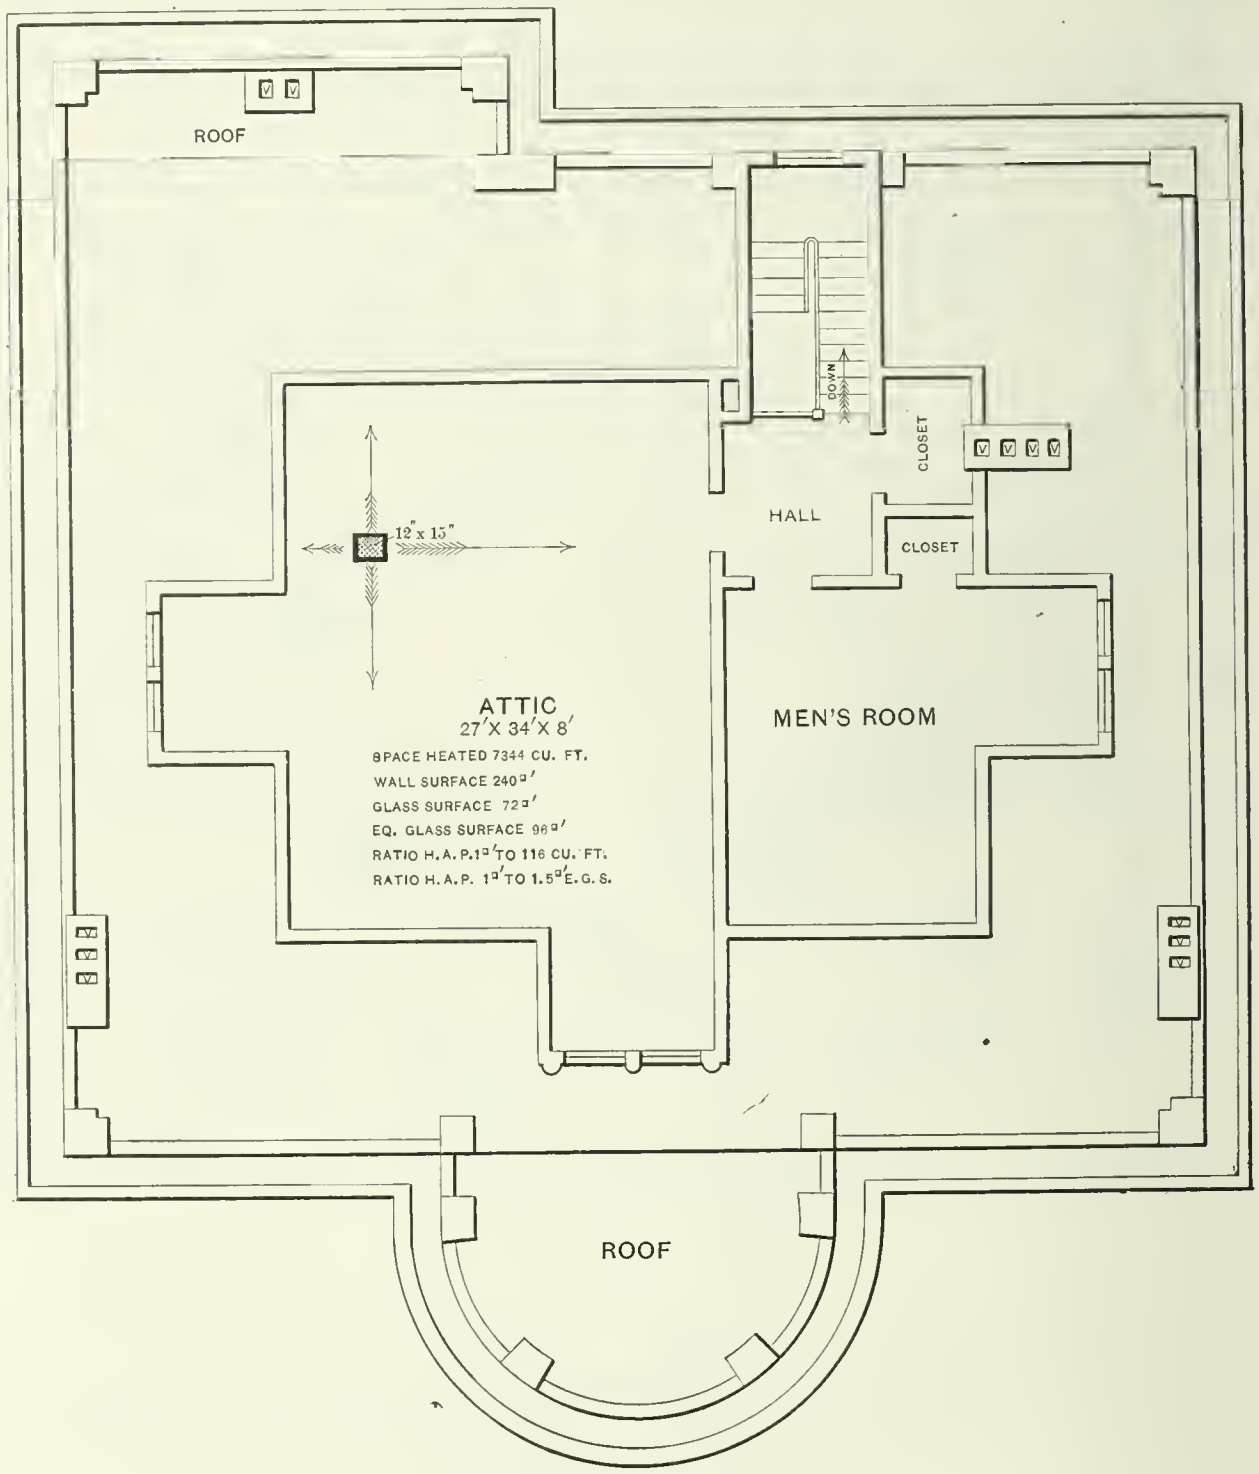

Fig. 3.—Plan of Third Floor.

THE FURNACE.

While the construction of the furnace shows it to be especially adapted for the use of natural gas, the construction of the burner is such that in case of failure of the gas supply it can be readily removed and either hard coal, soft coal or wood can be burned in the furnace. The fire chamber is 23 x 41 inches in size and provided with a grate of the labor saving variety. The furnace consists of a horizontal cylinder of heavy steel, 45 inches in diameter, resting horizontally on the cast iron front, with a suitable support at the back. Within this cylinder are the fire chamber, the grate and the ash pit, so arranged that the entire surface of the cylinder is efficient in heating, a part being exposed to the direct rays of heat from the fire chamber, while all the products of combustion rising out of the fire chamber must pass down under it and around the indirect draft partitions to the bottom, whence they run to the back and escape to the flue. Thus all parts of the cylinder are well heated. Air, in passing through the furnace, comes in contact with the surface at a higher temperature as it rises, leaving the hottest surface as it flows into the hot air pipes. This cylinder is inclosed in a double casing, the outer casing being composed of galvanized steel. There is at the most contracted point an air space having an area more than equal to the combined area of the hot air outlets.

RELATIVE PROPORTIONS.

In order that a comparison may be made of the system and the work done, the dimensions of the various parts are given as follows: The grate has an area of 943 inches, or 6.5 square feet. In this system this space is filled with a flame of intense heat from the gas. The

steel shell which incloses the fire chamber has an area of 81½ square feet, and the space heated in the building amounts to 45,555 cubic feet. The space heated exposes a wall surface of 3418 square feet and the windows expose a glass surface of 855 square feet, and on a basis that the cooling effect of 10 square feet of wall is equal to 1 square foot of glass, the equivalent glass surface is 1187 square feet. The grate surface bears a proportion of 1 square inch to 48.3 cubic feet of space heated and to 1.2 square feet of equivalent glass surface exposed, or a proportion of 1 square foot to 12½ square feet of heating surface exposed in the furnace, to 182 square feet of equivalent glass surface exposed and to 7008 cubic feet of space heated. The heating surface exposed by the furnace, which is 81½ square feet, bears a proportion of 1 square foot to 459 cubic feet of space heated, and to 1.4 square feet of equivalent glass surface exposed. The hot air pipe area bears a proportion of 1 square inch to 32.4 cubic feet of space heated, and to 0.8 square foot of equivalent glass surface. Each of the hot air pipes has a damper at the furnace, so that the pipe may be shut off or the flow of air through it regulated, as may be necessary.

VENTILATION.

In operation only fresh air from the outside has been used, and in addition to supplying the house with fresh, pure air, vent flues have also been provided in all the principal rooms. In these flues gas jets are kept burning continuously to keep the flues warm, so that they may have a good draft. An ornamental grate front is provided, the outlet to which has a slide damper, so that the amount of air exhausted by the vent stacks may be under control. The gas burner used in these flues is a simple one-jet burner to generate heat and is connected with a ¾-inch pipe, so that an ample supply of gas to the burner is insured. The size of these vent flues in most of the rooms is 6 x 12 inches, having an area of 72 square inches, but the heat generated by the burner is sufficient to secure an exhaust of air from the rooms amounting to very nearly the inflow from the hot air pipes. By this means a continual change in the atmos-

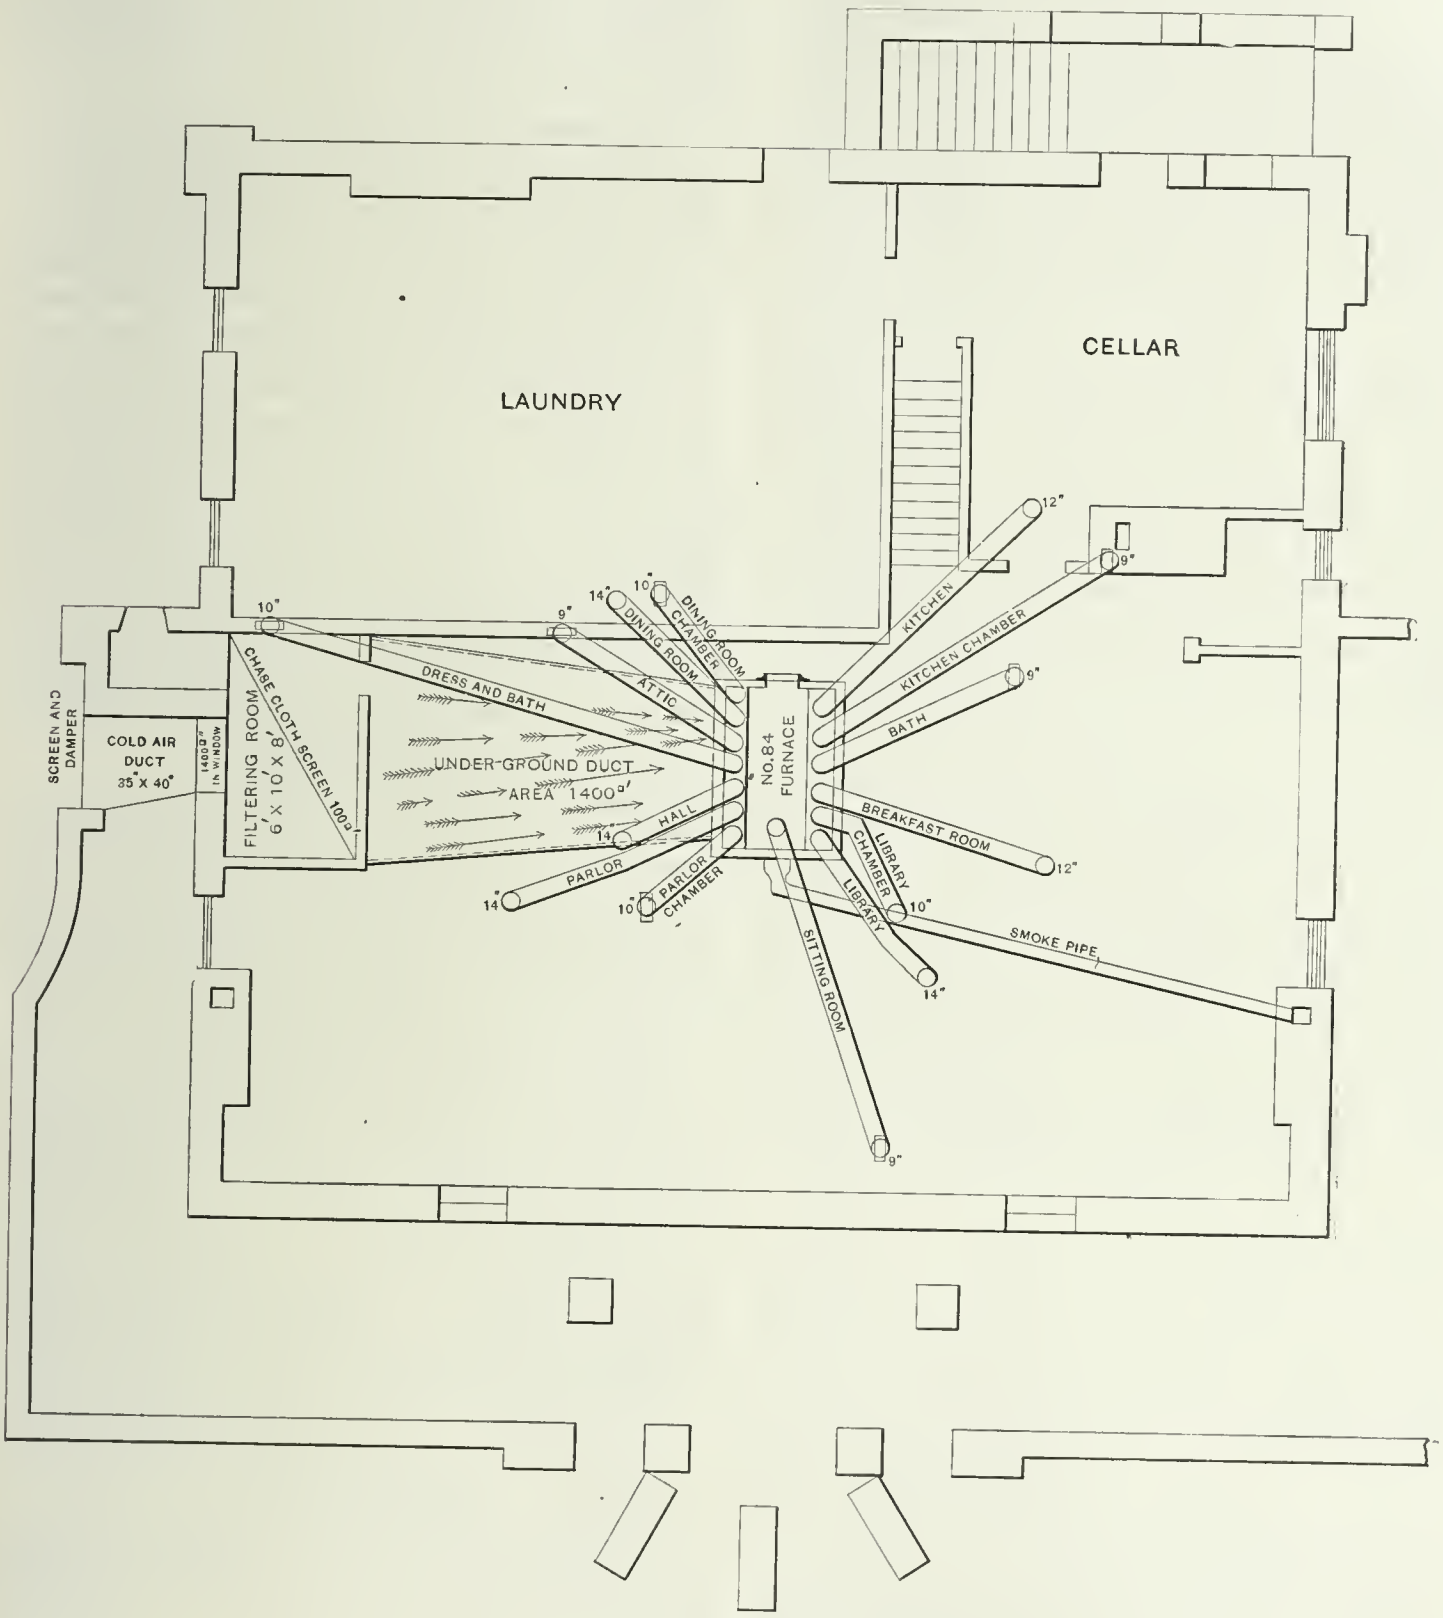

Fig. 4.—Plan of Basement, Showing Piping, Cold Air Supply and Filter.

phere of the building is effected, the heavier vitiated air being removed to make room for the inflowing fresh, warm air. By taking the air in at so low a temperature as 140 degrees and continously exhausting it any artificial moistening of the air has been found unnecessary. This heating and ventilating system has been in satisfactory operation during the past winter.

A MAGNIFICENT STOVE CATALOGUE.

What is probably the finest stove catalogue ever issued has just been brought out by the Michigan Stove Company of Detroit, Chicago and Buffalo. The company have distinguished themselves in the past by the excellence of their publications, which have invariably ranked among the most artistic contributions to trade literature. This year they evidently concluded to outdo themselves and they have done it. The new catalogue is in every respect a magnificent specimen of the book maker's art. It is of different shape from the ordinary catalogue, the page being 10 x 12 inches. The size of the page is well calculated for the use of large engravings, bringing out the details of the goods with much greater clearness than could be done with small cuts. The book comprises 176 pages and is bound in heavy boards, in scarlet cloth, with the company's name on the side heavily embossed and surrounded by a broad silver border. In addition to the bound pages an illustrated price book consisting of 80 pages is found in a pocket attached to the inside of the back cover. Inserted loosely in the book is a beautiful engraving of Jeremiah Dwyer, president of the company, taken on the fiftieth anniversary of his connection with the stove business in Detroit. This fine portrait of the esteemed president will undoubtedly be treasured by the patrons of the company.

A notable feature of the catalogue is the character of the title page and of the illustrated pages which mark the division of the book into various departments, according to the character of the goods. These pages bear fine engravings, the title page showing a picture of Vulcan framed in a laurel garland, having on one side the obverse of the first prize medal awarded to the company at the Paris Exposition of last year and the reverse of the medal on the other side. The pages marking the different departments are also suggestive of the Paris Exposition. An index of the telegraphic code words used in the price book forms the first page of the contents. This is followed by a beautifully illuminated page which reproduces the guarantee of the company, a copy of which is packed in every Garland stove or range. Next come remarkably fine views of the company's great works at Detroit and of their Western headquarters at 256 to 262 South Clinton street, Chicago.

The first department of the catalogue is that devoted to steel ranges and cook stoves and opens with an illustration of the company's lowest priced line of steel ranges, passing gradually to the most elaborate and expensive construction. The ranges which are shown in this department consist of the Surprise, Success, Special Garland, Jr., Savoy Garland, Jr., Staple Garland, Jr., New Empire Garland and Empress Garland. The department closes with an illustration and description of the Sunrise Garland steel cook.

Cast cooking stoves for soft coal or wood form the next division, these beginning with a low priced line and progressing to the higher priced goods. The stoves shown consist of the Ironton Garland, Jr., New Iron Garland, Jr., Iron Age Garland, Kitchen Garland, New Family Garland and Western Garland. In connection with these stoves illustrations are given of some of the special details, such as the method of ventilating the oven, the construction of the goose necked flue, the direct draft damper used and the double locked long centers. These are not only features of the cook stoves but of the ranges made by the company.

Cast ranges for soft coal or wood comprise the next department. The goods here shown consist of the Iron Garland, Jr., Standard Garland, Superb Garland and Crystal Garland. A lithograph in colors strikingly represents the fine finish of the aluminized oven used. A fine line of cast ranges for hard coal or wood come next and comprise the Phœnix Garland, Victor Garland, Puritan Garland and New Champion Garland.

Cast cooking stoves for wood only is a separate division, which includes the Oakland, Woodland, New Wood Garland, Jr., New Home Garland, Sylvan Garland and Atlantic Garland. Among the illustrations in this division is shown an original Detroit stove, made by Jeremiah Dwyer & Co. in 1861, before the incorporation of any of the Detroit stove companies. Although this stove was made 40 years ago, it would to-day be pronounced a very handsome stove, fit to adorn any line of samples. Cast ranges for wood only are shown in the next division, and comprise the Wood Garland, Jr., New Home Garland, Household Garland and Century Garland.

Base burners for hard coal or coke form a department which is specially beautiful in the character of the goods shown, their handsome decorations and the ingenuity with which details of ornamentation as well as construction have been perfected. The base burners comprise the Art Garland, Jr., Art Garland Modeled Series, Sunlight Garland, Art Garland Home Series, Art Garland New Series, Art Garland Duplex Series and Art Garland Reflector Top.

Oak stoves constitute an important department, as the company claim to have the largest and finest assortment of these stoves in the world. The goods shown are the Oak Garland, Jr., Oak Garland, New Oak Garland and Front Flue Oak Garland. Hot blast and self feeding heaters for soft coal constitute another department, embracing the Hot Blast Garland, Magic Garland, Solar Garland, Radiant Garland and Retort Oak Garland. The Retort Oak Garland is a self feeding stove which has remarkable fire keeping qualities, giving it all the advantages in that respect of a hard coal base burner. The stove is beautifully finished and is so elaborately decorated that it forms almost as ornamental a piece of furniture as a hard coal base burner.

Heating stoves for coal is a department in which are grouped the Carbon Garland, Avon Garland and Novel Garland, the last named being a Franklin stove. Heating stoves for wood is a department in which are shown the Hickory Garland, Jr., Rose Garland, Ivy Garland, Jr., Fireside Garland, Premium Garland, Yale Garland and Horizontal Oak Garland. These cover all classes of wood stoves, such as the box, cottage, air tight, base heating and revertible flue constructions.

Attention is specially called to the protective system of numbering, copyrighted by the company, which makes their system of numbering cooking goods distinctive, preventing other makes of cook stoves or ranges with small sized ovens from being compared with supposedly similar sizes in Garland goods.

Elaborate as this catalogue is it is not the only evidence presented this year of the Michigan Stove Company's enterprise. The catalogue is simply a fitting messenger to inform the trade of the very great preparations which have been made by the company for this year's stove business. We understand that they have revolutionized their entire line of stoves and ranges. New patterns and new dresses have been provided and the result is an array of brand new goods such as even this company never before presented for the consideration of stove buyers. The high standard of the catalogue, therefore, may be regarded as simply one of the essentials of the conduct of the company's business this year.

W. G. Withers and W. F. Habicht, two of the representatives of F. M. Borden & Bro., Philadelphia, Pa., are enjoying a well earned vacation at Atlantic City, N. J. Mr. Withers had just returned from a seven weeks' tour in the South, and Mr. Habicht from a six weeks' trip through Pennsylvania among the Stove trade. They report the outlook for the coming season in the Stove trade as good as they ever knew, both having exceeded their sales of any previous year up to this date. With their wives, Messrs. Withers and Habicht caught 214 crabs in one trip from Atlantic City and enjoyed a voyage on the steam launch of Robert M. Gibb, who is a Stove dealer at Second and Bainbridge streets, Philadelphia.

Eclipse Stoves and Ranges.

"A Booklet on Steel" is the title of a publication which is being distributed among the trade by the Eclipse Stove Company of Mansfield, Ohio. The matter treats of the Triumph Eclipse and the Surprise steel ranges, and the Astral Eclipse steel cook stove. Brief descriptive particulars accompany the various illustrations, also tables showing the number of sizes in which the goods are made, the oven dimensions, and the size of the fire box. In addition to the goods enumerated, attention is given to the Cyclone Eclipse hot blast; the Wonder Eclipse, a new sheet iron air tight circulator; the Prize Eclipse, a wood air tight, and a variety of oak stoves, which are offered under such names as the Perfect Eclipse, Mars Eclipse, Century Eclipse, Emery Eclipse, and the Sun Eclipse.

Accompanying the booklet is a four-page folder illustrating and describing the Lustrous Eclipse, a new hard coal double heating base burner of handsome exterior. The base flue is circular, thus securing, it is claimed, the greatest benefit of the fire in the heating of the exterior of the base. The hot air flue which takes the cold air from the floor occupies the space between the up and down back flues, thus deriving heat from them on two sides and from the fire direct on a third side. The result is a strong current of highly heated air, which can be utilized to warm the room above, or if desired, can by means of a damper of novel design be thrown into the room in which the stove is placed. The grate is of the Ransom duplex type with rotating outside ring. The fire pot is heavy and can be removed through the lower mica doors without loosening a bolt. The stove is made in two sizes and has fire pots 14 and 16 inches in diameter respectively.

Twin Burner Stoves.

We have received from the Twin Burner Vapor Stove Company, 206 to 210 South Seventeenth street, St. Louis, Mo., a copy of the catalogue which they have just issued for the season of 1901-1902. It consists of 40 pages of letterpress profusely illustrated and bound in deep red covers with embossed side title in old gold. The goods shown cover an interesting assortment of steel ranges as well as cast goods embodying the modern improvements. Among the features enumerated in connection with the Twin Burner steel range are heavy covers and centers, asbestos linings, ventilated oven finished in aluminum enamel, which prevents rusting; cast iron flue back, which the manufacturers claim tends to prevent eating out by creosote, and a body made of triple walls. Under the same name the company offer a steel cook stove for burning coal and also for burning wood. Among the cast goods may be mentioned Our Pride, Crown, Princess, Eureka and Ideal cook stoves. The heating stoves are represented by the Hot Blast for burning hard or soft coal, the National, a laundry stove for coal, and a line of air tights, which include the Queen City and the Banner.

ODD PLATES.

Carey A. Moore is making a trip through the Virginias in the interest of the Acorn line of Stoves and Ranges, made by Rathbone, Sard & Co., Albany and Aurora, N. Y. He reports a fair trade for the season and a growing popularity for the Acorns he is sowing along the line.

Southard, Robertson & Co., 257 Water street, New York, are sending to the trade two circulars showing goods that should be interesting at this season. One is devoted to the Flag Cylinder Stove, which is made in sizes from 8 to 12 inches with illuminating anti-clinker door, draw center shaking and dumping grate, top cover and sliding top. The base is so made that the cylinder fits ash and dust proof. The other circular shows several sizes of the Girard Range, which is made with high shelf, reservoir and end ash pit and is furnished with water back. It is made with 7, 8 and 9 inch covers and with oven 16, 18 and 20 inches square. The Range is of attractive design and is full nickeled.

The Richardson & Boynton Company, New York, have just made a shipment to Holland of two of their Perfect Hot Air Furnaces with complete equipment of piping, register boxes and registers; in fact everything necessary to set the furnaces up for operation. They have also furnished complete working plans and detailed drawings for the guidance of the foreign workmen, as well as full written instructions for setting up and operating the hot air system of heating.

The showroom of Isaac A. Sheppard & Co., at 312 Pearl street, New York, has been arranged with an attractive display of heating goods. The Fern is a very pretty sheet iron cylinder stove, and the Magic Base is made with both black and planished iron bodies, direct draft and revertible flue. The concern announce that they have a supply of these goods in stock and that the shortage in sheet iron will not interfere with shipments being made promptly. The Comet, a handsome square Stove, also made as a double heater, to heat an upper room with hot air by means of a register, is another Stove displayed. It is full nickeled and well calculated to please the buyer.

Schellhammer & Son, Warren, Pa., report that their Pennsylvania Gas Furnace trade is rapidly increasing. These Furnaces are finding their way into the hands of high-class Furnace dealers, who heretofore looked upon the Natural Gas Furnace as an experiment for the reason that many were such, whereas the Pennsylvania has proved its success wherever installed under instructions of the manufacturers. The Furnace was originated and patented by C. Schellhammer, and all Furnaces are manufactured under his supervision. Having had 30 years' study and practical experience in this branch, during which time he has had extensive correspondence from considerable territory bearing on the subject of the adaptation of the Gas Furnace to the varied requirements of buildings, he has been enabled to solve many knotty problems in heating. The house are always ready to assist their customers in devising plans that will heat any building by natural gas.

The value of exports of Stoves and Ranges from the United States in the fiscal year ended June 30, 1901, is given in the official figures of the Treasury Bureau of Statistics, just issued, as $548,716, as compared with $535,385 in the preceding fiscal year, and $503,739 in the fiscal year 1899.

The works of the Gem City Stove Company at Dayton, Ohio, were visited by a fire on August 2, which destroyed the machine shop, foundry and storeroom. The loss is partially covered by insurance.

Edwin A. Jackson & Bro., 50 Beekman street, New York City, have issued their 1901-2 catalogue of the Jackson Ventilating Grate. The merits of this device are set forth at considerable length, illustrations being presented showing the old and new way of heating by means of an open fire. Much that is of general interest in connection with heating is to be found within the covers of this 40-page catalogue, and in addition there are illustrations of Andirons, Fire Sets, Portable Grates, Dampers, Door Knockers, &c.

We have been favored with an invitation from W. T. Leckie, representing the Estate of P. D. Beckwith, manufacturers of Round Oak Stoves and Furnaces, Dowagiac, Mich., extending the hospitality of their rooms at the Cadillac Hotel, Detroit, Mich., during the annual meeting of the Michigan Retail Hardware Dealers' Association, which occurs in that city on the 14th and 15th inst. The invitation is printed on a large card folded into two leaves, one of which bears a representation in colors of the now famous Indian, "Doe-Wah-Jack."

The Grander Stove Company, Royersford, Pa., have resumed operations after a month's shut down for the usual inventory and repairs.

The McClary Mfg. Company, London, Ontario, are sending out to their friends in the trade an eight-page folder, calling attention to some of the leading lines of Oil Stoves which they are prepared to furnish. Among these may be mentioned the Famous Coal Oil Heater, every part of which is of sheet metal, and which is especially adapted for the heating of a bedroom, dining

room, office, &c.; the Novelty Blue Flame Wick Oil Stove, the Dangler Wickless Oil Stove, made with high and low frame in a variety of sizes, and the Summer Queen Oil Stove, made with two burners and having extension top. The company refer in our advertising pages this week to their Yukon Triple Heater, which is claimed to be "as powerful as a small furnace and much more economical." It burns wood 30 inches long, and the products of combustion travel the length of the Stove three times before entering the smoke pipe.

The Excelsior Steel Furnace Company, 38 West Monroe street, Chicago, are announcing that owing to the strike and the increase in price of tin plate and sheet iron their quotations on Furnace Pipe, Fittings and Adjustable Elbows are withdrawn and that new prices will be furnished from time to time as required. They report a large stock and suggest the advisability of ordering Furnace Casings, Conductor Pipe, Eave Trough and Supplies while they can be shipped promptly.

Ross & Kontny, 153 to 159 South Jefferson street, Chicago, managers of the Western branch of the Reading Stove Works, are enjoying an extremely active trade in their Sunshine line of heating apparatus. They have already sold more Steam and Hot Water Boilers this year than were sold through the Western house of these works in all previous years put together. Their Furnace trade also has been heavy, practically double that of last year. They have found the demand running toward the best grades of heating apparatus. The cheaper styles are neglected, which shows that consumers are not looking for lowest prices, but are endeavoring to get best results. They further have no complaint to make of their Stove business, which is keeping quite up to last year's volume.

Stove and Hardware Dealers.

The J. M. & L. A. Osborn Company, Cleveland, Ohio, in a circular letter to the trade announce that they are ready to take care of orders at their new location, 26 to 36 Viaduct. While they are not entirely settled, the company still feel that they can give their customers much better service doing business at one place rather than having their force divided between the old and the new locations. They urge as a special favor that customers will telephone orders ahead whenever possible, so that they can have the goods laid out and ready for immediate delivery when called for.

Henry N. Clark & Co., 56 and 58 Union street, Boston, Mass., in a circular advise the trade that they are the New England agents for the American Stove Board Company, and that they carry a full stock of all sizes of Crystallized, Aluminum, Embossed, Oxldized, Zinc, Mosaic and Onyx Stove Boards. The firm also carry the Aluminum Bargain and Rival Oil Heaters, and are prepared to fill all orders for these goods promptly.

The Retail Stove and Sheet Metal Workers' Association of Wilmington, Del., organized recently with the following officers: President, Isaac S. Bullock; vice-president, Edward Davis; secretary, William J. Johnson; treasurer, George L. Stradley; trustees, William Alexander, William Gallagher and Charles H. Blaine. The organization has 18 members and its object is to benefit the trade and their customers.

Joseph M. Lydon, Harrisville, Ohio, informs us that he is about to sell out his Stove and Hardware business, on account of advancing years. Mr. Lydon adds that he has been a regular reader of *The Metal Worker* since its first issue, and has been identified with the trade for more than 40 years.

Kilbourne & Jacobs Mfg. Company, Columbus, Ohio, have just issued their general catalogue No. 33, of 84 pages, relating to Drag and Wheel Road Scrapers, Bolted Wheelbarrows of all kinds, Contractors', Railroad and Grading Plows, Tubular Steel Dirt, Mining, Foundry, Coal and Coke Barrows, Contractors', Railroad and Farm Dump Carts, Wrought Steel Sinks, Pressed Steel Shop Pans, &c. They call special attention to the many additions to and improvements in former lines since the issue of their last catalogue. They also issue catalogue No. 7, of 128 pages, relating to Trucks, including Baggage Barrows, Depot Express Wagons, Push Carts, &c., and catalogue No. 31, 72 pages, relating to small Cars of all kinds, Contractors' Dump Carts, Steel Ore and Mine Cars, &c.

We are advised by the White Mountain Freezer Company, Nashua, N. H., that the daily newspaper accounts of the fire in that city on the 26th ult. were greatly exaggerated so far as their loss was concerned. The company are in a position to execute all orders promptly. They luckily escaped with the loss of their foundry building and one or two other small buildings of less importance. They succeeded in saving the balance of their plant, and business has not been interrupted in the slightest degree.

Louis Stanton, Frostburg, Md., is one of the enterprising dealers in that section. He carries a fine line of Stoves and Ranges, with a fair sprinkling of Rathbone, Sard & Co.'s Acorns among them. His stock includes general Hardware, Guns, Ammunition, Cutlery, Rope, Oils, Paint and all kinds of Vehicles. Mr. Stanton has a large trade in the surrounding country and has opened a branch store at Lonaconing.

Geo. H. Oetzel, who has been identified for nearly 23 years as manager of the Hardware department of the A. H. Foster Company and their predecessors, A. H. Foster & Co., Foster, Wilkins & Co. and Foster & Wilkins, Union, S. C., will succeed to the Hardware business of that company about September 1. He will occupy three floors and will carry a full stock of Shelf and Builders' Hardware, Agricultural Implements, Stoves and Kitchen Furnishings, and also Paints, Oils and Varnishes. Mr. Oetzel will be pleased to receive catalogues, price-lists, &c., relating to the above lines.

The Hunter-Harris Company, Rising Sun, Ind., have disposed of the grocery part of their business and will hereafter devote their exclusive attention to the sale of Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements and Sporting Goods.

Fox Bros., Pine Bluff, Ark., whose business was established in 1882, have incorporated under the style of Fox Bros. Hardware Company, the capital stock being $100,000. The personnel of the concern continues unchanged. They do a wholesale and retail business in Shelf and Heavy Hardware, Tinware, Agricultural Implements, Stoves, Sporting and Athletic Goods, &c.

F. W. Cole, Ethan, S. D., has admitted a partner in his Hardware and Stove business, and the style is now Cole & Buckles. The firm are erecting an addition to their main building and will devote it to tin shop purposes.

Atkinson Hardware Company, wholesale Hardware, Stoves, Tinware, Farm Implements, Wagons and Buggies, Fort Smith, Ark., have been succeeded by Atkinson-Williams Hardware Company, who will continue at the old stand. The company report that the year closing June 1 showed the largest business in the history of their house, and with additional storage room and better facilities for handling goods they contemplate a marked gain for the present year on the one just ended.

On July 6 the entire business portion of Versailles, Ohio, was destroyed by fire. Among the stores burned out was the Hardware establishment of Manier & Pequignot, which firm have since been dissolved. The business will be continued by Joseph Manier, Jr., who will be pleased to receive catalogues and other matter pertaining to Hardware, Stoves, Tinware, Farming Implements, Bicycles, &c.

Manufacturers of Stoves and heating apparatus and supply houses will be interested in a new 40-page catalogue just issued by the Kirk-Latty Mfg. Company, Cleveland, Ohio. The index is divided under the heads Bolts, Tapped Nuts, Stove Rods, Screws, Rivets, Tacks, Nails and Taps, and the illustrations show a variety of Bolts, Nuts and Screws specially adapted to the requirements of Stove makers. Sink Bolts, Carriage, Tire and

Pin Head Bolts, Iron and Brass Machine Screws, and a variety of special Square, Round, Countersunk and Slotted Bolts and Screws are presented. One section of the catalogue is devoted to Tacks of all kinds, priced in bulk and put up in little barrels in cabinets for retail use. The company also make Clout, Finishing, Trunk, Basket, Chair and Cigar Box Nails.

LITCHFIELD & COLE are successors to Litchfield & Frazer in the Hardware, Stove, Wagon and Buggy business in Lone Oak, Texas.

A "KEEP COOL" WINDOW.

BY INSPIRATION.

When the recent hot spell made physical effort of any character almost unbearable it was fortunate that mental activity could be indulged in while seeking such comfort as could be found in absolute quietude. It has been my custom to endeavor to turn whatever caused me inconvenience, annoyance or discomfort to profit whenever possible. So when a desire for relief from the intense heat suggested to my mind many things that would make life more pleasant, even if the scorch continued, I concluded that these suggestions should materialize in the form of a "keep cool" window, which would bring me customers, profit and popularity in suggesting a means by which other people might find relief from the heat.

A "Keep Cool" Window.

After the cool of the evening set in I told two of the clerks that I would stand treat for all the ice cream they could eat if they would aid me in preparing an attack on the pocketbooks of my customers by helping to erect the fortifications. One was set to removing everything that had been in one of my show windows, while with the other I selected the materials for my display. I decided that in one corner, at the back, I would have a pyramid of water coolers of different sizes, and in the opposite corner I would have a refrigerator with the lower door open, showing some lettuce, cucumbers, lemons, raspberries and other things that would be inviting to the appetite during a hot spell. For a background I had a pyramid of ice cream freezers, the bottom row being composed of large freezers, smaller ones being used for the top. A little 1-pint freezer, suitable for use in making ice cream at the tea table, was at the very top. Across the window, above the pyramid, I had a Mexican grass hammock, light blue in color. From the hammock I hung a variety of fans, from the large sized palm leaf "Sabbath Day cooler" to the grotesque Japanese spread and folded fans. I placed near the center of the window a big "take me home for 98 cents" folding leg dress-maker's table. On this I placed a large bright dish pan, and, suggestively alongside of it, a pile of lemons, lemon squeezers, knife for cutting the lemons, ice pick, cork screws, several two-story tumblers, a tin shaker, such as is used for mixing cool drinks, and a bundle of straws.

In one glass I had red lemonade with a slice of lemon floating in it, and two straws sticking invitingly out of the top. In another I had orangeade with some raspberries floating in it. In another was lemonade with a slice of orange and a couple of strawberries in it, and near at hand was a big box of sugar. On the other end of the table I had a large japanned tin waiter on which was arranged several saucers with tin spoons, alongside of which was a bundle of cheap tin teaspoons wrapped in blue tissue paper, suitable for picnic parties. Beside this waiter was an ice cream freezer with the top and crank taken off, and conveniently at hand was one of those funnel shaped ice cream measurers. Several big tin spoons, suitable for dipping out the ice cream, and one of the new wrought iron, tinned, with wooden handle ice cream scoops. To carry the illusion further I had a bright young mason to ladle me out some "white coat" on the saucers in such a manner that it looked very much like hard ice cream. There was ample space on the table for several styles of ice picks, individual ice cream molds, also larger forms, such as are used for gelatine and puddings. Sticking out of the lemonade pail was the bent handle of a tin dipper, and on the table beside it was a dipper of another style, also a very handsome Britannia dipper with an ebony handle.

In front of the table, where it could readily be seen, was an ice cream freezer with the crank taken off and all ready for receiving a batch of material to be frozen. On a piece of rough burlap was a big chunk of glass and several smaller pieces, which I was able to collect, to resemble ice; and conveniently at hand I put a pair of ice tongs, an ice pick, ice hatchet, two different styles of ice shavers, chippers and an ice maul, then a small bag of coarse salt, with some ice cream molds, milk pails and other suggestive tinware.

When we had got thoroughly into the spirit of arranging this "keep cool" window the boys showed considerable interest and put in a number of other little things that had escaped my mind, as coarse graters and nutmeg graters. One thought that we ought to have a pineapple to suggest pineapple water ice, and when the work was completed the best compliment we received was from a stout old gentleman, who stopped to look at it, and said it had entirely changed his feeling. Instead of feeling hot he felt for his pocketbook to see whether he had money to buy an ice cream freezer and some of the lemonade and paraphernalia we had shown.

White Enamel Refrigerators.

A dainty catalogue has been issued by the White Enamel Refrigerator Company of St. Paul, Minn., descriptive of their special line. The company manufacture a refrigerator having the provision chambers lined with white enamel, which not only presents a neat and attractive appearance, but makes the interior so light that the contents can easily be seen and at the same time enables the walls of the chambers to be very easily cleaned. Another feature of these refrigerators is the use of Bohn's patent dry air siphon system, owned by the company. By this system the cold air passes through a galvanized iron grating in the bottom of the ice chamber into the provision chamber, rising through the opening provided for the shelves, and is drawn back through the siphon into the ice chamber and through and around the ice, causing all vapors and odors given off by the provisions to condense and become deodorized, leavlng all impurities to pass off through the drip pipe with the water from the ice. The company state that by this system they are enabled to secure an average temperature in their refrigerator of 38 to 48 degrees. They further state that those figures can be reduced, lf desired, to a point below 32 degrees by the use of rock salt in the chamber.

The styles shown comprise a full variety of sizes for domestic purposes and large sizes for the use of grocers and restaurant keepers. A speclal slze is made, intended for flats or apartments with limited floor space. The catalogue contains a number of testimonials, showing the high esteem in which the refrigerators are regarded by those who have used them, these testimonials including railroad companies. who have equipped their dining, buffet and refrigerator cars with the Bohn siphon system.

Wire Wound Cast Iron Pipe.

M. Jacquemart, the managing director of the Société Metallurgique d'Aubrlves et Vllleruplt, France, has introduced the system of winding steel wire, under pressure, round the extremities of the plpe and ln grooves cast in the body of the pipe. The idea of shrinking steel bands onto cast iron cylinders is very ancient, but the problem was to find some method whlch would cause the bands to follow exactly the shape of the parts to be enveloped and exert an even pressure throughout. Thls is accomplished by the method of winding above referred to. In the manufacture of pipe all complicated machinery must be rejected, and it was therefore essential to provide a method of winding whlch, while being perfectly simple in its application, would secure perfect uniformity of tension in each wire wound round. M. Jacquemart started from the fact that a steel wire of uniform dlameter has a constant resistance throughout lts length. He devised a method by which the wire is passed through a draw plate, which reduces it to a certaln fixed diameter. Winding at an equal and constant pressure is effected by revolving the pipe, the wire first passing through the draw plate above described under the desired amount of tenslon. Another important point is the bedding of the ends. This ls effected by shaplng the edges of the grooves so that the wire can be bedded into them and thus be securely fixed; and for greater security molten tin is poured over every end. Asphalt is put on at high temperature, which penetrates the spaces between the coils and completely covers them. Experiments with these steel bound pipe indicate that with them lt is possible to avoid a burst with a large main. Their behavior under such conditions as sudden and instantaneous shocks shows that pipe of this type is proof agalnst a burst, and that even when strained to the point of fracture the damaged parts remain in thelr original posltlon. A cast iron main of this type 78 inches in diameter has been laid by the water company of Paris.

Ground was broken on Tuesday preparatory to the construction of the third new East River Bridge, which ls to connect Manhattan with the Williamsburg section of Brooklyn.

The Heating Trade in the West.

The Western heating trade has seldom, if ever, been more active than at present. Heating contractors are driven with business to the full extent of their facilities, and maufacturers of boilers and supplies are only llmited in their trade by the output of their factories. Great difficulty is experienced in securing pipe of sizes under 2-inch. Galvanized pipe of small diameters ls particularly scarce, and in some localities a premium is being offered for those sizes in general use. A peculiarity of the present condition of trade is the excellent demand for the best class of heating apparatus. Consumers are not shoppling so closely as in other years and do not hesitate to pay the price asked for a good boller, being evldently most desirous of securing efficient service. The trade is in such excellent condition that many things are now permitted or overlooked in the way of commercial practices which in times of dullness would cause considerable friction. The activity in building throughout the West gives promise of running lnto next year, which excites the hope in the heating trade that the good times now being enjoyed may be indefinitely extended.

The Comfort Steam and Hot Water Heaters.

To meet the varied demands of the heating trade, the Thatcher Furnace Company, 240 Water street, New York, have just put on the market a new line of steam

The Comfort Steam and Hot Water Heater.

and hot water heaters. The name "Comfort" is well chosen, as the construction enables them to be readily handled, placed in buildings and set up by the steam fitter, and to be easily managed by the owner. They are specially adapted to residence work, owing to the conveniences provided. The ash pit is strong, to support the upper parts, deep to afford ample air space under the grate, and so made as to support a grate of the labor saving, clinkerless, dumping type, which has been thoroughly tested in other apparatus. The grate can be readily removed through the ash pit door and access to its surface with a poker can be had through a slicing door. The ash pit door is of ample size and fitted with a lift door for connection with the damper regulator. The fire pot and combustion chamber are designed to present the greatest possible surface to the

fire, bring the largest amount of water into contact with hot surface, and facilitate a circulation that will insure a steady water line in the steam boilers.

The fire pot proper is corrugated to increase the fire surface, to afford free ingress of air to the fire and to keep the fire clean and at its best efficiency. The combustion chamber is high, to give space, and divided, to increase the surface overhanging and exposed to the direct rays of the fire, by inward extending lobes, as can be seen by the broken view presented herewith. The upper sections are made with a series of tapering flues to further utilize the heat of the products of combustion and to increase the surface over which the water circulates. When these sections are used they are staggered to further increase the fire travel.

The steam heaters are provided with the usual equipments of the best grade. They are made with an ample steam dome, and it is claimed that the construction insures the production of dry steam. The heaters are made with 24 and 28 inch fire pots and, by the addition of intermediate sections, in six different capacities, rated to carry 550, 610, 675, 875, 925 and 975 square feet of direct steam radiation, the piping to be included as radiation. The hot water heaters are rated to carry 900, 1000, 1100, 1350, 1500 and 1650 feet. The steam heaters run from 54 to 68 inches in hight, adapting them for use in low cellars.

THE MUELLER BOILER.

A sectional view is given herewith of a new horizontal section boiler for steam and water, which has just been brought out by the L. J. Mueller Furnace Company, Milwaukee, Wis. This boiler is made of the best grade of cast iron, is attractive in design, and the workmanship is of the highest character.

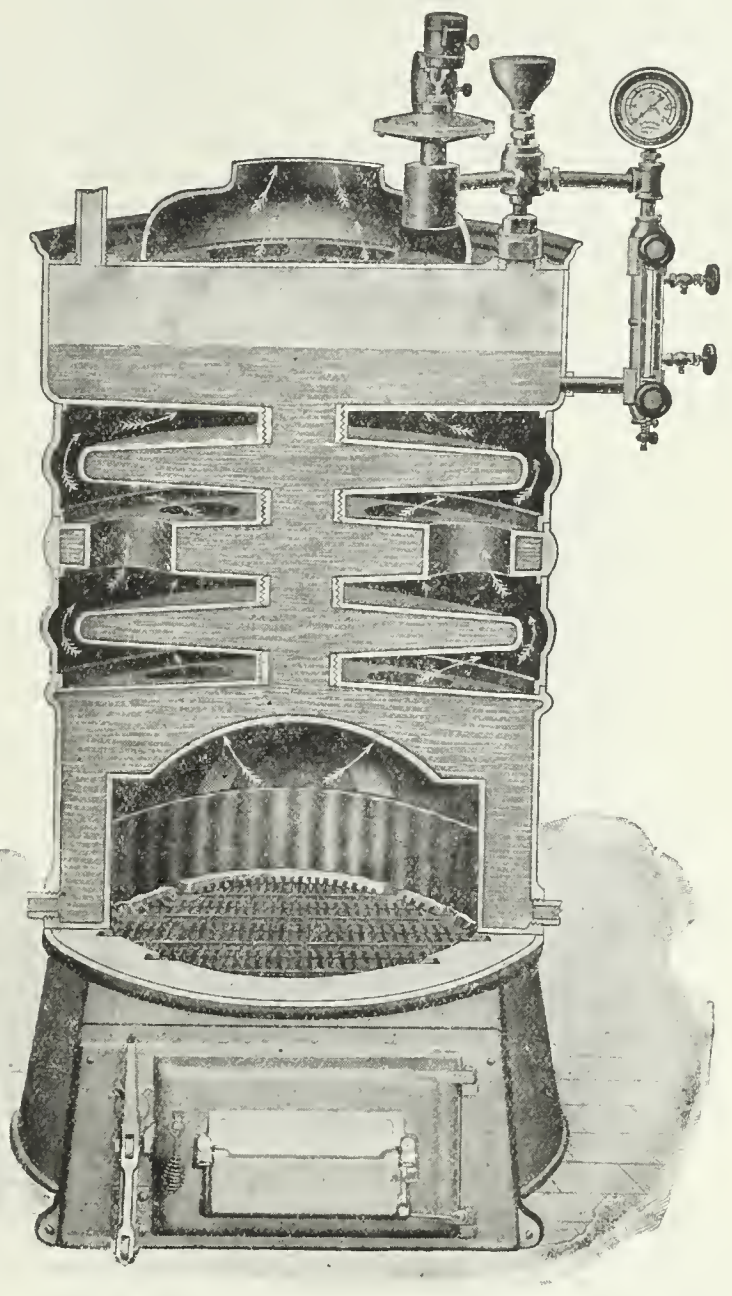
The company call special attention to the construction of the fire pot and the intermediate sections between the fire pot and the dome. In the fire pot, which is of unusual depth, the large center column is connected by radial arms with the sides to secure perfect circulation within the boiler itself. The center column and radial arms, containing a considerable quantity of water, overhang the fire in a most effective manner. The value of overhanging surface is best demonstrated by the excellent results secured, even when only a low fire is maintained. The inner surface of the fire pot is constructed with deep corrugations, thus presenting fully one-third more fire surface, backed by water, to the direct radiant heat of the fire than if constructed without these corrugations. By means of these corrugations free circulation of air is also insured at the edge of the fire.

The sections are connected by means of lathe turned screw nipples. These nipples are of ample diameter to secure free circulation within the boiler, and inasmuch as in this form of construction expansion is from the center outward, there is experienced absolutely no difficulty with broken sections, while the nipple secures a tight and lasting joint. The smaller of the sections is without flue openings, so that the gases in their travel to the smoke flue are obliged to impinge against the entire lower surface and travel completely around the outer edge of section. This makes additional fire surface. The larger of the sections is provided with flue openings of sufficient area to allow a free circulation of the gases and to avoid any clogging of soot.

Ample space is provided for steam and its thorough disengagement from the water, thus overcoming the tendency, common to many boilers, to produce an unsteady water line or throw water into the piping. Arrangements are made in this boiler for the introduction of a coil of pipe in the fire. This coil of pipe is designed to heat water for domestic purposes, and is an economical device for supplying necessary hot water during the season when the heating apparatus is in use.

The boiler is provided with a rocking and dumping grate, which is simple and effective. The grate ring has been entirely eliminated, and the base itself becomes the holder or support for the grate bars. When it is desired to dump the fire, the small check shown is given a one-quarter turn, thus releasing the connecting bar and allowing it to be drawn outward, so that the grate bars stand in a vertical position, clearing themselves immediately of all accumulations without the use of poker.

Each section, and subsequently the boiler complete, is thoroughly tested before shipment. The trade will find this an easy boiler to erect. In the water boiler, all sections above the fire pot are shipped made up. The steam boiler is shipped in the same manner, except that the dome or top section is not connected. The company



The Mueller Boiler.

are prepared to furnish 13 sizes for either steam or water, thus covering a wide range of requirements.

Champion Hot Water Combination Boilers.

A new catalogue has just been issued by Frank D. Stolz, 115 Lake street, Chicago, illustrating and describing his Champion hot water combination boiler. The Champion is a new hot water heater which will fit any furnace, thus converting it into a combination heating apparatus. The device has but recently been brought out, yet sufficient time has elapsed to enable it to win popular favor. The catalogue just issued illustrates the special features of the boiler in detail, and gives a list of the sizes made and their capacity in square feet of radiation, together with prices. Illustrations are also given of furnaces, showing the boiler properly attached to secure the best results. The Champion is made in a great variety of sizes, from a small water heater with sufficient capacity to heat water for ordinary domestic use up to a large and powerful apparatus which will furnish 700 square feet of radiation. These boilers are tested to 100 pounds hydraulic pressure before leaving the factory and are guaranteed not to leak.

The Wireton Automatic Time Draft Regulator.

An ingenious device, herewith illustrated, has just been placed on the market, which is designed to automatically turn the draft on a furnace, steam boiler or hot water boiler. It is a combination of a time draft, a draft regulator, a guaranteed time piece and an alarm clock. It can be placed either in an upper room or in the basement. With this device the drafts may be turned completely off, and at 5 or 6 a.m., or any other predetermined hour for which the clock has been set, the regulator is released and the draft is automatically turned on. The clock is an alarm clock of the standard pattern and can be used as an alarm in conjunction with operating the heater drafts if so desired. A pivoted dog in conjunction with a ratchet constitutes the entire mechanism of the regulator. The dog is tripped by the clock at the hour for which it is set, and a weight then pulls the regulator into proper position to close the check and open the draft.

This regulator can be used during the day to control the drafts of the furnace or boiler independently of the operation of the clock. The regulator is such a simple device that it can hardly get out of order. Anybody

The Wireton Automatic Time Draft Regulator.

can adjust and operate it. It appears to be a very effective arrangement for saving money by avoiding the useless burning of coal, and at the same time supplying a convenient arrangement for making the house comfortable in the morning, without the necessity of somebody rising early for that special purpose. The manufacturers of this regulator are the Wireton Heating Company, Blue Island, Ill., whose Chicago office is located at 40 Dearborn street.

Imico Heaters.

The Illinois Malleable Iron Company, 30-32 West Monroe street, Chicago, are issuing a new catalogue to bring to the notice of heating contractors their Imico steam and hot water heaters. These heaters are of the vertical sectional type, the larger sizes being made with the sections in two parts for ease in handling. The location of the crown sheet increases the heating surface and the return flues cause the gases to give up their principal heat before escaping. The waterways facilitate heating and a steady water line. Screw nipples are used and a feature is made of the correct alignment of all the parts. The boilers are made to carry from 475 to 4000 feet of steam radiation. The catalogue also shows their Ætna heaters, pipe hangers, floor plates adjustable floor sleeves and the Eureka combiuation circulation fitting for hot water. This fitting has become very popular with the trade, as it saves labor and cost and aids circulation.

THE Board of Health of Erie, Pa., has ordered the revised plumbing regulatious of that city to be printed.

New York City Notes.

Trade still continues brisk in all branches and nearly every shop is getting its share. The main difficulty is in collections, which are unusually slow.

* * *

John H. Graham of East Thirtecnth street is about again, having fully recovered from a severe operation he recently underwent.

* * *

The wife of John Muir of James Muir Sons & Co. died last Monday from a malignant carbuncle.

* * *

It is too bad that the "Shoot the Chutes" was not at College Point the day of the Brooklyn Branch outing instead of at North Beach, as several who attended might have stayed much later.

* * *

L. H. Wenzel of 705 Columbus avenue is doing the plumbing in a large private house on Seventy-seventh street, opposite Manhattan Square, for the Louis Webber Building Compauy.

* * *

Chas. Hensle, iu addition to his other large jobs, has the plumbing contract for the extension to the Hebrew Orphan Asylum, on Amsterdam Avenue Hill.

* * *

B. P. Eldridge of 145 East Seventeenth street was the successful bidder for the plumbing contract for the Earle Building of Columbia University.

* * *

Alex. Bryant has some large contracts on hand, including the addition to the Grand Union Hotel; a mansion at Alexandria Bay for Geo. C. Boldt, proprietor of the Waldorf-Astoria, and the Martinique Building, to be erected on the block at Broadway, Thirty-third and Thirty-fourth streets.

Heating and Plumbing Notes.

A PLUMBER who brought suit against the master plumbers of Norfolk, Va., on the charge of maintaining a trust and applying a boycott to the damage of his business failed to prove his case and a verdict was rendered in favor of his opponents.

THE FOWLER & WOLF MFG. COMPANY, Radiator manufacturers, Philadelphia, Pa., now have their own foundry plant and factory, which is located at Norristown, Pa., running on full time, and announce that their facilities for manufacturing Radiators, &c., have been greatly increased and improved.

THE steam fitter will be held in kindly remembrance by his customers who uses the Atlas Radiator Pedestals under all the Radiators he places in residences. They are made by the Atlas Radiator Pedestal Company, New London, Conn., for all widths of Radiators. Where they are used the carpets on the floors can be readily laid or taken up by the women of the house. They are so made that when the top of the Radiator is pushed back till all the weight is on the back legs the Pedestal will spring open and allow the edge of the carpet to be pushed back to the baseboard, or taken out, as desired.

W. E. PAUL, 39 to 45 Market street, Portsmouth, N. H., who makes a specialty of sanitary engineering and steam and hot water heating in addition to his local business, does a great deal of work in the fine residences along the coast of Maine. He has sent *The Metal Worker* a folder inclosing some fine views of a section newly opened to builders, called High Pasture, at York Cliffs.

THE secretary of the Board of Health of Attleboro, Mass., has sworn out warrants for the arrest of plumbers doing work in that city without a license.

WILLIAM WARD, Poughkeepsie, N. Y., bid $15,000 and secured the contract for piumbing and heating the Vassar Hospital additions. It is uuderstood that the work will not only be of an extensive nature, but of a high order.

A STRIKE among the plumbers in Minneapolis, Minn., has been caused by alleged violations of the old agreement between the masters aud journeymen for the for-

mer to employ none but union men and the latter to work for none but members of the association. Some members have withdrawn from the association and this, it is claimed, has created the trouble.

JOHN C. MCKERNAN, Pottsville, Pa., has secured the contract to install a hot water heating plant in the Market street school building in that town and will use a Monarch Sunshine Boiler made by Orr, Painter & Co. of Reading, Pa.

THE SANITARY ENAMELING COMPANY, Milwaukee, Wis., are sending out special sheet No. 1, announcing that they are introducing a new line of Enameled Sanitary Goods. The circular shows half-tone engravings of some fine Lavatories and Sinks and states that Bathtubs, Pantry Sinks and Hoppers will follow. The company report that while their line is new and will have some new attractions the enameling business is fully understood by them, as it is not a new feature to them. Henry Stein is the manager of their New York branch, at 48 Cliff street.

THE BIGELOW COMPANY of New Haven, Conn., have taken a contract to furnish four Steam Boilers in connection with the steam heating plant to be installed by the Connecticut Hospital for the Insane. The bid was about $6000.

JAMES DONOVAN, Middletown, Conn., has been awarded the contract to do the plumbing at the new building to be added to the Hospital for the Insane in that city.

A NEW method of heating cars has been adopted in Christiania and Stockholm, according to the *Railway Herald* of London. The apparatus consists of long, perforated boxes, one under each length of seats. The boxes are filled with red hot briquettes of compressed coal, prepared so that no smoke or smell results from their consumption. Iron sheeting is arranged under the seats which allows the fumes to escape into the open air. On fresh air passing through a ventilator placed under the coal box at the bottom of the car the hot combustible gases pass through this iron sheeting throughout its entire length, diffusing a steady heat into the car through a set of perforated iron plates placed between the legs of the seats. The speed of the car develops sufficient draft to completely consume the briquettes. It is asserted the system has been found entirely satisfactory, even on the score of economy.

A LETTER from James C. Gormly informs us that after two years' soldiering in the Philippines he has returned to Macon, Ga., and opened a plumbing and tinsmithing shop at 320 Third street. He succeeds his stepfather, Robert Falkner, who died during his absence. Mr. Falkner was an old time Scotch tinner. He established the business before the Civil War and built up an enviable reputation for good work. Mr. Gormly learned the trade under him and is well acquainted with the old customers, all of whom he hopes to retain. He desires to receive catalogues and quotations from manufacturers and dealers in goods in his line.

THE business of George P. Clarke, manufacturer of Clarke Exhaust Fans, at Windsor Locks, Conn., has been incorporated under the name of the George P. Clarke Company, and will be conducted along the same lines and under practically the same management as heretofore. The officers are George P. Clarke, president, and George E. Clarke, secretary, treasurer and general manager.

W. H. SCHLABACH, secretary of the School Board of De Witt, Clinton County, Iowa, will receive bids until August 30 for a hot water heating system for a school house in the Independent District.

THE STOVER MFG. COMPANY, Freeport, Ill., are erecting a new plant, into which they hope to move by October 1. The company have purchased a tract of land, 21½ acres in extent, of which 6½ acres will be covered with shops. There will be four buildings, as follows: The warehouse and shipping department, 320 x 77 feet; the wood shop, paint, packing, blacksmith and galvanizing departments in a building 554 x 77 feet; the power house, machine shop, assembling rooms, stock rooms and experimental department in a building 468 x 77 feet, and the pattern shop, core room, foundry, rattling room and stock room for castings in a building 418 x 77 feet. The buildings will be built of stone with asbestos roof, and will be equipped with an automatic sprinkler system.

THE GLAMORGAN PIPE & FOUNDRY COMPANY, Lynchburg, Va., manufacturers of Cast Iron Gas and Water Pipe, Special Castings, &c., have leased the large Pipe works of the Radford Pipe & Foundry Company, at Radford, Va., which have a capacity of from 125 to 150 tons per day. The company advise us that the latter works are in active operation, with orders ahead for all the Cast Iron Pipe they can furnish for some weeks, and that they are making preparations to start up the special foundry and will soon be in shape to turn out heavy loam castings of almost any description.

LEWIS A. COLEMAN has been appointed assignee of the Monarch Mfg. Company, Indianapolis, Ind. The company were organized in 1897 with a capital stock of $75,000 and have for a long time conducted a successful business in the manufacture of Acetylene Gas Generators, Wire Fencing, Wire and Brass Novelties. It is expected that the company will be reorganized. In the meantime manufacturing operations will be continued under the direction of the assignee.

THE AMERICAN RADIATOR COMPANY have declared the regular quarterly dividend of 1¾ per cent. on their preferred stock, payable August 15.

JAMES & GATES, 156 Fifth avenue, New York, are now displaying samples of the Our Own line of Steam and Hot Water Heaters printed attractively to aid in following the fire travel over the surface presented.

HOBEN & DOYLE, Philadelphia, Pa., have been awarded a contract for plumbing the Mississippi State Capitol buildings, Jackson, Miss.

BIDS will be received at the office of the commissioners of the District of Columbia at Washington, D. C., until September 21 for a steam power plant and connections at the Trumbull street pumping station.

CHARLES O'NEILL, Peoria, Ill., bid $1279 and was awarded the contract for plumbing the Greeley School building in that city.

THE SIMS COMPANY, Erie, Pa., are sending to the trade an eight-page booklet showing the Sims Exhaust Heads, Flue Scrapers, Flue Blowers and Oil Filters. The Exhaust Heads are made for pipes from 2 to 20 inches in diameter and are said to be excellent condensers and water savers.

New Firms and Changes.

THE G. F. BARD COMPANY have been incorporated at Norwich, Conn., with a capital of $10,000, by George F. Bard, G. Percival Bard and Charles Tyler Bard, to deal in Iron, Steel, Copper and other metals, and Mill and Plumbers' Supplies.

THE BOSTON SANITARY MFG. COMPANY have been incorporated, with principal office in the Corporation Trust Company Building, 15 Exchange place, Jersey City, N. J., to manufacture Sanitary Articles, &c. The concern have an authorized capital of $260,000. The incorporators are Robert M. Wilson, Chas. M. Hosmer and L. G. Moore.

THE COLUMBIA HEATER COMPANY of Paterson, N. J., have been incorporated to manufacture Radiators, with a capital of $25,000, by Herman E. Frommelt, Lucy B. Frommelt, Henry Henning and William H. Henning.

A. J. SMALL has opened a plumbing shop at Waynesboro, Pa.

J. P. BRICKLEY has bought the steam heating business of C. E. Lewis, a hardware merchant, and added it to his plumbing business in a new store at 407 Commercial street, Emporia, Kan.

TRUE C. FIFE has bought out the interests of his partners in the heating and plumbing firm of Fife Bros., Carter & Co., at Reading, Mass., and has become sole proprietor. The retiring partners are James C. Carter and Will McG. Fife. Mr. Carter will remain in the employ of Mr. Fife. The new proprietor has already closed contracts for remodeling the heating system at the Melrose Post Office, for the plumbing of the new residence of Harry L. Dane and for the plumbing and installing of a water heater in the house of Mrs. Robert Powers.

The Amalgamated Strike,

Since our last report some very important developments have occurred in connection with the Amalgamated Association strike. In the latter part of last week it seemed that the strike would be settled, as the entire Executive Committee of the Amalgamated Association went to New York Friday night, August 2, and were in conference on Saturday with J. P. Morgan, and E. H. Gary, chairman, and Charles M. Schwab, president, of the United States Steel Corporation. It was the purpose of securing a modification of the J. P. Morgan proposition that took the Executive Committee of the Amalgamated Association to New York City, but their trip was fruitless. The conference lasted several hours, and at its close the Amalgamated Association and the United States Steel Corporation were wider apart than at any time since the strike started. The cause of the conference and what took place at it is perhaps best described in an official announcement which was given out by the Amalgamated Association shortly after the conference ended. It is as follows:

We, the members of the Executive Board of the Amalgamated Association of Iron, Steel and Tin Workers, deeming it incumbent upon us to enlighten the public through the press with reference to the present relations between our association and the United States Steel Corporation, present the following statement: The officials of the United States Steel Corporation, instead of resuming negotiations where they were suspended at the conference held July 11, 12 and 13, have withdrawn the propositions made at that time and are now offering much less than they agreed to sign for then.

The following is the proposition which the United States Steel Corporation gave us to-day as their ultimatum. It will be observed that the preamble states that the United States Steel Corporation officials will "advise" settlement by the underlying companies:

Preamble: Conditions under which we are willing to advise settlement of labor difficulty. Proposition. Tin Plate Company—Business shall proceed under contract signed with the Amalgamated Association as of July 1, 1901.

American Steel Hoop Company.—Company should sign the scale for all the mills owned by the American Steel Hoop Company that were signed for last year.

American Sheet Steel Company.—Company should sign the scale for all the mills of this company that were signed for last year, excepting the Old Meadow and Saltsburg mills.

We desire to preface our proposition by directing attention to the fact that it is a modification of that which we offered originally. At the last conference, as at those preceding it, we required signature of the scales for all the mills owned and operated by the United States Steel Corporation, while in the proposition given below we asked that the scale be signed for none but those mills which are organized and where the men ceasing to work have signified their desire to be connected with the Amalgamated Association. This modification has been made because the trust officials declared that we wished to force men into the organization against their will and desire. We therefore asked that the scale be signed for only those men who desire it.

Proposition of the Amalgamated Association: We, the members of the Executive Board of the Amalgamated Association, hereby present the following proposition as a reply to that received from the United States Steel Corporation:

Sheet Mills.—All mills signed for last year, with the exception of Saltsburg and Scottdale, and with the addition of McKeesport and Wellsville.

Hoop Mills.—All mills now known to be organized—viz.: Youngstown, Girard, Greenville, Pomeroy, Warren, Painter, Lindsay & McCutcheon, Clark, Monessen, Mingo and bar mill, 12-inch, 9-inch and hoop mills of the Cleveland Rolling Mill Company.

Tin Mills.—All mills except Monessen.

Note.—All matters of detail to be left for settlement by conference.

We, furthermore, wish to state that our purpose in coming to New York was not because we doubted our president, T. J. Shaffer, and secretary, John Williams, who have our confidence and indorsement, but in the hope of obtaining settlement of the strike.

GENERAL STRIKE ORDERED.

As the result of the failure of the conference President Shaffer on Saturday night issued the following order calling out all the Amalgamated men employed in any of the mills of the United States Steel Corporation:

Brethren.—The officials of the United States Steel Trust have refused to recognize as union men those who are now striving for the right to organize. The Executive Board has authorized me to issue a call upon all Amalgamated and other union men in name and heart to join in the movement to fight for labor's rights. We must fight or give up forever our personal liberties. You will be told that you have signed contracts, but you never agreed to surrender those contracts to the United States Steel Corporation. Their officers think you were sold to them, just as the mills, with contracts and all. Remember, before you agreed to any contract you took an obligation to the Amalgamated Association. It now calls you to help in this hour of need. Unless the trouble is settled on or before Saturday, August 10, 1901, the mills will close when the last turn is made on that day. Brethren, this is the call to preserve our organization. We trust you and need you. Come and help us, and may right come to a just cause.

The strike order will affect the National Steel Company's works at New Castle and Mingo Junction, the Frankstown, Republic and Riverside works of the National Tube Company, and most of the mills of the Federal Steel Company at Milwaukee, Joliet and South Chicago. It is not at all certain, however, that the union men in all these plants will go out. The extent to which the strike will spread can only be determined when the time comes for the order to go into effect. But it is unlikely that the United States Steel Corporation will be crippled to the extent hoped for by the association. A good deal of wild talk is being indulged in about the number of men called out by the strike. Thus, we have been told that 25,000 and even 50,000 men of the American Sheet Steel Company are out of work. The fact is that all the plants employ about 9000 men.

THE SHEET MILLS.

Meanwhile the Amalgamated Association has met with two defeats which may go a great way to break the strike. The strikers have met signal defeat at Wellsville, Ohio, and Hyde Park, Pa., where the American Sheet Steel Company's plants have been started up on a nonunion basis. All the mills of the Kiskiminetas Valley, which are under the management of E. W. Pargny, are nonunion. These embrace the works at Vandergrift, Apollo, Old Meadow, Scottdale, Saltsburg, Leechburg and Hyde Park, and in these works more than 50 per cent. of the output of the American Sheet Steel Company is made. While nothing official has been given out, it is probable that the Wood works at McKeesport, which have been closed since July 1, will be started in a short time. It is not anticipated that there will be much difficulty in getting sufficient men to operate these works, which are the second largest owned by the American Sheet Steel Company.

THE TIN PLATE MILLS.

The strike affects the American Tin Plate Company more seriously than any of the constituent concerns of the United States Steel Corporation. All the tin mills of the concern have been closed since the night of July 13, with the single exception of the Monessen works—that is, in the rolling and heating departments, but the tin house employees worked up the black plate that was on hand when the strike was declared This, however, has about been exhausted and very little work is being done in any of the tin mills of the American Tin Plate Company. The situation, however, will probably be relieved in a short time by the fact that the American Tin Plate Company are importing 6000 tons of black plate from Swansea, Wales. This black plate is expected to reach New York this week and will be distributed among the various plants of the American Tin Plate Company, and will be followed by further importations of larger amounts. It is believed that the tin house men, who belong to the National Protective Association of Tin Plate Workers and whose scale has been signed, will not break their contracts with the American Tin Plate Company, but, on the other hand, it is likely these men will work up this black plate, and if so it will help out the American Tin Plate Company on their contracts to a very great extent. If the tin house men refuse to work this black plate they will break their agreement, and if this is done the United States Steel Corporation will likely refuse to have any dealings whatever with this organization in the future. It is possible the American Tin Plate Company may import tin and terne plate from the other side, but this has not been fully determined upon. If such a course were pursued it would mean a loss to the American Tin Plate Company on every box, as the price obtained under their contracts would be less than the cost of laying down for-

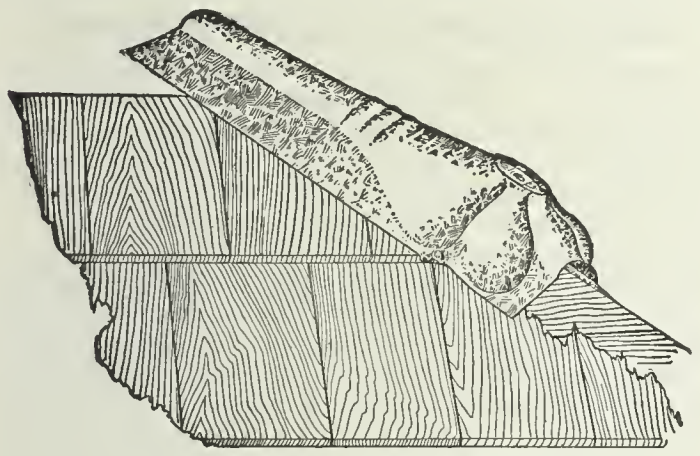
eign plate at tidewater points. The next few days will bring out some very important developments in the strike and make the situation, as regards the strength of the Amalgamated Association, much clearer than it is now.

LABOR LEADERS CONFER.

A significant development in connection with the strike is the conferences that have been held in Washington and Pittsburgh between President Shaffer and officials of the Amalgamated Association and President Gompers and Secretary Morrison of the American Federation of Labor. The purpose of the conferences was to discuss the extent to which the Federation of Labor might participate in the strike should the Amalgamated Association call for assistance. The conclusion reached appears to have been to the effect that it would be unwise for the Federation to take any active part in the strike, and that if the Amalgamated Association should appeal for aid the policy of the Federation in response should be determined by a meeting of the full Executive Council. At the time of writing the head officials of the two organizations were in conference in Pittsburgh, where Messrs. Gompers and Morrison have gone to study the situation at short range. Meanwhile both sides are awaiting the outcome of the general strike order when it becomes effective on Saturday night. The claims put forth on either side as to the results that will be developed from it are widely at variance.

Adjustable Stamped Metal Hip Shingle.

The Galesburg Cornice Works, Galesburg, Ill., have just placed on the market the Adjustable Stamped Metal Hip Shingle, which is herewith illustrated. These



Adjustable Stamped Metal Hip Shingle.

shingles are stamped from tin, galvanized iron or copper, and are designed for use on hips of shingles or slate roofs, and are adjustable to varying courses of shingles. They are an effectual protection against leaks and curling shingles and make a very ornamental hip finish. These hip shingles are made in two sizes, 4 x 9 inches, for use with wood shingles, and 5 x 12 inches for slate roofing. Both sizes are adjustable to different widths of shingles or slate shown to the weather.

Pancoast Ventilators.

An interesting catalogue is being distributed by the Pancoast International Ventilator Company, 223-225 South Fifth street, Philadelphia, Pa., devoted to the Pancoast ventilators. Following the introduction there is given the record of a test showing that the Pancoast ventilator begins to exhaust in a wind blowing but 3.2 miles per hour, and increases rapidly in capacity as the wind gains in velocity. The company's guarantee is conspicuously presented. An attractive feature of the catalogue is the number of fine half tone engravings showing trucks loaded with ventilators for shipment to West Australia and large buildings where these appliances are in use, such as railroad wharves, iron works, office buildings, cotton mills, sanitariums and hotels. The ventilators are made round, oval and square, suited for use on skylights, lantern roofs, chimney tops and ventilating flues. The text and sectional engravings make the construction and operation of the Pancoast ventilators readily understood, and a number of testimonial letters, together with a long list of customers, give evidence of their popularity.

FLASHINGS.

WORK was resumed last week at the rolling mills of the National Enameling & Stamping Company, at Granite City, Ill., after the usual summer shut down for repairs.

THE TOWNLEY METAL COMPANY, Kansas City, Mo., have completed a new warehouse, more than doubling their capacity. The new building is of mill construction, well equipped to store and handle goods economically and expeditiously. In addition to their line of Tinners' and Roofers' Supplies, they will put in a stock of General Hardware. Geo. E. Garland will look after the Hardware end of the business. For the past eight years Mr. Garland has been with the Turner Hardware Company, of Muscogee, I. T., as salesman and buyer. Previous to that he was connected with the McGregor & Noe Company, Springfield, Mo. He worked his way up from the tinner's bench to his present position. The Townley Metal Company are to be congratulated on having secured his services.

HERMAN GEHNRICH, 69 Rutgers Slip, New York, informs us that he has admitted his son to partnership under the firm name of Herman Gehnrich & Son. They have opened a branch at 208 East Fifty-seventh street, where they are prepared to do all kinds of Tin, Copper and Sheet Iron work. The firm make a specialty of Exhaust and Blow Pipe work, Skylights and Cornices, and also make Enameling Ovens, do Roofing, put up Leaders and Smoke Stacks, Chimney Caps and Ventilators. They desire to receive catalogues and price quotations of goods in their line.

H. WEISS & Co., 20 Cliff street, New York, in addition to handling all kinds of Sheet Metal Working Machinery, are carrying in stock a large assortment of Skylight Gearing in all sizes. They invite Skylight makers to examine this stock and to get their prices. The firm are also prepared to furnish the Union Grinders, which are well adapted to the shops of Sheet Metal workers and Stove dealers, as they are run by foot power, and tools can be readily sharpened and Stove and other castings ground to fit much quicker than by filing.

AMONG recent contracts for Metal Ceiling work by the Penn Metal Ceiling & Roofing Company, Limited, 14 Harcourt street, Boston, Mass., are ceilings for Woolworth's 5 and 10 cent store in Boston, 7500 feet for the Lane Building, Keene, N. H.; 17,500 feet for a parochial school in Haverhill, Mass.; Ceilings for four Government buildings at Fort Greble; 10,000 feet for the Folsom Building, Lynn, Mass.; 13,000 feet for the Shepard Building, Providence, and smaller jobs in Lawrence and North Adams, school houses in Athol and Shelburne Falls, Congregational churches at Hampstead, N. H., Littleton, N. H., and Thompson, Conn., and the M. E. Church, Milan, N. H.

THE IOWA CAN COMPANY of Des Moines, Iowa, recently organized with a capital of $50,000, have taken over the business of Thompson & Keisey, and have also purchased the Can and Tin working machinery of the Manning Signal Lamp Company. It is reported that the new concern will erect one of the largest Tin Can and Box factories in the West.

CONTRACTS have been let for rebuilding the burned Tinware and Sheet Metal factory of Hemp & Co., 904 South Second street, St. Louis, Mo.

THE HEEKIN CAN COMPANY of Cincinnati, Ohio, have been incorporated with a capital stock of $100,000.

THE PROTECTIVE VENTILATOR COMPANY, 129 Fulton street, New York, are sending out a letter calling attention to the advisability of equipping buildings with ventilating apparatus during the summer months so that they will be ready for use when the weather makes them desirable. The company also distribute a

card giving directions for using their Protective Ventilators, which are designed to be attached at the bottom of a window so as to insure an inflow of fresh air in such a manner that it is distributed without having the effect of a draft.

THE mill building of the Curtis Sheet Steel & Corrugating Company of Zanesville, Ohio, a steel structure 300 x 100 feet, is rapidly nearing completion. The Pawling & Harnischfeger 20-ton crane is completed and in position. Their electric plant is almost ready to start and the crane will be tested in a day or two. All of the materials for their engines, mills and furnaces are on the ground and only awaiting the starting of the crane to be placed in position. The building for their corrugating department is nearly completed. The battery of eight tubular boilers are set and only await steam connections to be ready for operations. A large number of cars of raw material have already been received and the company expect to be rolling sheets by September 1.

THE promoters of the Chicago Tinplate & Can Company are considering the comparative advantages of a number of locations which have been offered to them in the vicinity of Chicago. The plant will be a large one and the company will require about 40 acres of land. They expect to effect an organization some time this month and to settle upon a site, after which their plans will probably be announced.

Gas and Oil Fields of the West and Southwest.

A bulletin issued by the United States Geological Survey contains information of interest regarding the oil and gas fields of the West and of Texas. The report says the productive territory is being constantly extended, as there is a demand for gas as fuel and as oil is proving a profitable resource. The principal productive field of the Western interior area is in southwestern Kansas and the northern part of Indian Territory, although both gas and oil in limited quantities have been found as far north as Kansas City and along the western border of Missouri. The report says the coal measure rocks of Iowa thus far have not proved productive. The small flows of gas there are sporadic and the exploitation of that field has been attended with considerable uncertainty and risk.

According to the report the Beaumont oil has a gravity of 22 degrees Baume, has an asphalt base and contains a considerable quantity of sulphur. "Tests show," says the report, "that the percentage of light oils which it contains is very low and it is therefore regarded as a fuel oil. The cluster of wells at Beaumont which have reached the oil deposits are 4 miles south of the center of the town and within a radius of ½ mile from the first discovery. Up to June 15 those actually recognized as producers numbered 11."

Regarding present prospecting in the Texas field the report continues: "The active drilling has been nearly all confined to the Spindle Top Heights and thus far has developed a field of limited extent. Some of the wells situated very near to the producing territory are now proved to be failures. This has caused a more conservative spirit among the operators and the oil business is beginning to be conducted on a more careful basis. The fact that the reservoir under Spindle Top Heights appears to have only a limited extent does not preclude the possibility of finding oil in the same general horizon in other places. Instead of a continuous field prospectors should expect to find a number of small fields occurring at wide intervals."

LOMBARD & Co., 236-238 A street, Boston, Mass., have just issued a fine illustrated catalogue of their Grindstone product, including Stones to run by power and hand, Grindstones for use on shipboard, Grindstone Fixtures, both hand and power; Holystones, Curriers' Rub Stones, Glass Cutting Stones and Wheels, Curve and Beveling Stones, &c. This business was established in 1827, and the concern operate their own quarries in Nova Scotia and New Brunswick, besides being large importers of English Stones. They have for some time been making a specialty of Grindstones for glass cutting, used by glass bevelers and opticians.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

LINING A LEAD TANK.

From W. R. N., New Haven, Conn.—I have a tank to line with lead and I am going to wipe the corners with solder. The tank is to hold salt water. I desire to know if the action of the salt water will eat the solder away, and if it does, what can be done to prevent it.

Answer.—The surfaces of the lead in the corners should be thoroughly tinned and the seam wiped carefully with good solder, when it is probable that there will be nothing in the action of the salt water to interfere with the durability of the seam thus made. If the seams in the corners of the tank were made by the lead burning process there would be absolutely nothing that could cause the tank to leak except the eating away of the lead itself. If the tank is small so that it can be placed in convenient position for the work the lead burning can easily be done with illuminating gas, by securing a compound blow pipe. The work can be more readily done if Yager's salts is used to prevent the lead from oxidizing in the front of such a flame. If it is done with a regular lead burning machine, using oxyhydrogen gas, no soldering fluid would be necessary. The use to which the tank is to be put would determine whether it would be advisable to go to this extra trouble, but for all ordinary purposes it is probable that the wiped seam will prove satisfactory.

CALCULATION OF SLATE ROOFING.

From W. E., Orange, N. J.—Referring to the formula given to "A. A. B." in *The Metal Worker* March 30 on the calculation of slate roofing I cannot see why, after deducting the lap from the length of the slate, the remainder is divided by two. The result seems to me to expose only one-half of the area of each slate.

Answer.—In the formula it was not explained that the lap was to be made on the second course below the top or last course laid and the intermediate course was to be laid so as to divide the surface exposed evenly between it and the slate below it. At the point where the lap is taken into consideration there are three thicknesses of slate. The surface exposed to the weather, instead of being the length of the slate less the lap, is just one-half; hence the division by two.

SHEET METAL BOATS.

From J. S., Woodbury, Conn.—I have an idea that I can make a boat, using iron pipe for the frame work and galvanized sheet iron for the covering. I want to make it so that I can put in a naphtha engine to propel it. It will be used on a river and should be of light draft, and the bottom should be flat rather than round; yet it must carry about ten persons. Is such a boat feasible, and can *The Metal Worker* furnish drafts of plans?

Note.—The question of making sheet metal boats is one that frequently comes up, and *The Metal Worker* will be glad if any who have made such boats will use its columns for presenting such drawings and descriptions of the process of manufacture as will be of assistance to its boatbuilding readers. In the meantime we would say that in *The Metal Worker* of May 25, 1901, an article on sheet metal boat construction was presented, and it is probable that our correspondent could modify the instructions therein given to meet the requirements of his case. An article on the manufacture of sheet metal canoes was presented in our issue of July 22, 1899, and in *The Metal Worker* of November 10, 1894, a picture was given of a sheet metal launch, propelled by a two horse-power gasoline vapor engine, that was said to run easily seven miles an hour. From this our correspondent

can judge that his proposition is feasible, and by consulting the files of *The Metal Worker* he can secure such assistance as the articles mentioned furnish.

THE AREA OF A TRAPEZIUM OR IRREGULAR SHAPED ROOF.

From Apprentice, Passaic, N. J.—Will you kindly inform me through the columns of *The Metal Worker* the shortest way to find the number of square feet in a trapezium, representing an irregular shaped roof, as for instance, in those of the inclosed sketches?

Answer.—Our correspondent's sketches are shown in Fig. 1 of the annexed diagrams. A trapezium is a rectilinear figure of which no two sides are parallel. There is no rule for finding its area except to divide it into two triangles by drawing either diagonal. To find the area of a triangle it is necessary to know the length of one of its sides, assumed as the base, and also its altitude, or the distance from the base to the opposite angle, measured on a line at right angles to the base. The rule for finding the area of a triangle is: Multiply the base by the altitude and take one-half the product. To obtain its area when the length of the three sides only are given, it is best to first construct the triangle to as large a scale as possible, then drop a perpendicular from one of its angles to the opposite side and measure the length of the same by the scale, after which the above rule may be applied. An inspection of the diagrams given in Fig. 1 will show that they are not drawn to scale. It is impossible to construct a four-sided figure when the lengths of the sides only are given. At least one angle must be known. In the larger of the two diagrams, neither angle as drawn is a right angle, consequently unless one of the diagonals is known the figure cannot be constructed or measured.

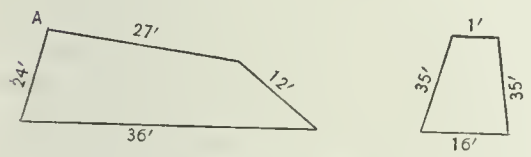


Fig. 1.—Reproduction of Correspondent's Sketches.

If it be assumed that the angle at A is a right angle the figure may be constructed as shown in Fig. 2. Draw A B and A C at right angles to each other, making them respectively 24 and 27 feet, to any convenient scale. From B as a center, with a radius equal to 36 feet, strike an arc which intersect with another arc drawn from C as center with a radius equal to 12 feet, and draw B D and C D to the point of intersection. Now draw the diagonal B C. Since the angle at A is a right angle, the area of the triangle A B C may then be computed by the rule as follows: $24 \times 27 = 648$; $648 \div 2 = 324$ square feet. Before the area of the other triangle B C D can be computed a line perpendicular to one of the known sides, as B D, must be drawn from the opposite angle, C. Therefore from C draw the line C E at right angles to B D, and measure its length by the scale. Supposing its length is ascertained to be 11.9 feet, the area may be found as before: $\frac{36 \times 11.9}{2} = 214.2$ square feet. The area of the trapezium is, therefore, the sum of the areas of the two triangles, 214.2 and 324, which is 538.2 square feet.

In the practical work of measuring a roof to obtain its area care should be taken to measure the necessary altitudes (distances measured at right angles to a base line), or such diagonals as will furnish the means of constructing their figures on paper.

In the smaller of the two diagrams in Fig. 1, as the two sides are the same, it may be assumed that the 16-foot side and the 1-foot side are parallel, the two 35-foot sides making equal angles with either. This being the case the figure becomes a trapezoid. To find the area of a trapezoid, multiply half the sum of the parallel sides by the altitude. Half the sum of the parallel sides is $\left(\frac{16+1}{2}\right) = 8\frac{1}{2}$ feet. In this, as in the former problem, the altitude is not given. The figure can either be constructed to scale, as shown in Fig. 2, and the altitude measured, or the altitude may be obtained by the use of square root from the figures given. To construct the figure to scale first draw the base line 16 feet long, then locate the point C, whose distance from A is equal to the difference between the parallel sides (16 — 1), which is 15 feet. From A and C as centers, with a radius of 35 feet, strike two arcs intersecting each other at D. From D draw D E parallel to A B, and from B draw

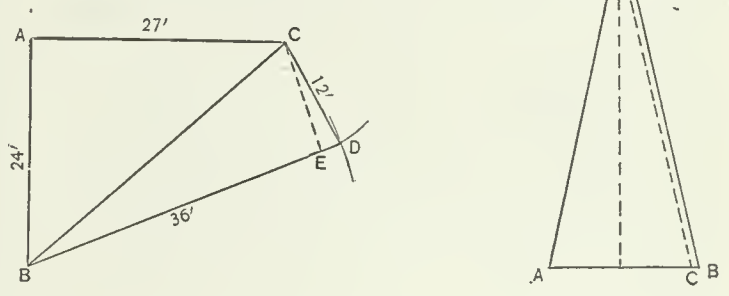

Fig. 2.—Shapes Shown in Previous Figure Drawn to a Scale of 24 Feet to the Inch.

THE AREA OF A TRAPEZIUM OR IRREGULAR SHAPED ROOF.

B E parallel to C D, completing the figure. A perpendicular from D or E to the base, as D F, will give the required altitude, which may be measured, and its length multiplied by 8½ feet, above obtained, to obtain the area.

The length of the perpendicular let fall from D to the base line may be obtained in figures by the application of the old rule—viz.: The square of the hypotenuse of a right angled triangle is equal to the sum of the squares of the other two sides. Since A D and C D are equal, the perpendicular let fall from D will divide A C into two equal parts. The base A F of the right angled triangle A D F is therefore equal to 7½ feet, the square of which is 56¼. The square of A D, the hypotenuse (35×35), is 1225, and since this is the sum of the squares of the other two sides, the square of the perpendicular must be $1225 - 56\frac{1}{4}$, which is $1168\frac{3}{4}$. By extracting the square root of this figure the altitude is ascertained to be 34.18+ feet. The area of the trapezoid A D E B is therefore 8½ feet $\times$ 34.18+ feet, which is 290.53+ feet. Should the angles at A and B be unequal the figure would then become a trapezium, and its area could only be constructed by knowing one of the angles, or what amounts to the same thing, knowing the length of one of the diagonals.

HOW SHOULD RADIATORS BE CONNECTED?

From I. R., Norwich, N. Y.—I would like to get the views of the readers of *The Metal Worker* as to what is the best way of connecting a first-floor radiator and a second-floor radiator with the end of the main of a hot water heating system so that the circulation through one radiator will not interfere with the circulation through the other. What would be the effect of using a twin ell on the end of the main under such circumstances?

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and rather weak.

Copper continues quiet and without change.

Pig Lead is dull and unchanged.

Spelter is weak and dull.

Antimony is without change.

Nickel remains firm and in good demand.

Aluminum is in active demand at former prices.

Tin Plates are getting scarce and about $1 a box higher.

Black Sheets are very active and strong in price, with scarcity developing.

Galvanized Sheets have been marked up about 10 per cent.

Old Metals are dull and weak.

Sheet Copper is in fair demand and firm in price.

Pig Iron is quiet and without change in price.

Hardware is moving in good volume, with prices stiffening in some lines, owing to the strike.

Plumbers' Supplies are in good demand and prices show upward tendency.

Wrought Iron Pipe is firm and scarce; New York jobbers advanced price on Merchant Pipe 5 per cent.

Steel Clad Bathtubs have undergone a further advance of 5 per cent.

Plumbers' Brass Work is very firm, with continued good demand.

Poultry Netting Staples are higher.

Stove Pipe and Elbows have stiffened, owing to scarcity of material and large demand.

Tinware is much stiffer and was advanced 10 per cent. this week.

Enameled Ware is about 10 per cent. higher.

Galvanized and Japanned Ware also tends to higher prices.

Wire Nails are in good demand and unchanged.

Cut Nails continue in fair demand, with prices unchanged.

Wire is strong and active.

Linseed Oil is high and unchanged, but lower prices are looked for.

Spirits Turpentine has advanced ½c. a gallon.

METAL MARKET.

NEW YORK, August 9, 1901.

Pig Tin.—Business has been quiet throughout the week under review, with none but comparatively small orders being filled. The cutting off of the largest consumer of Tin by the strike at the mills has caused an increase in stocks here, resulting in weakness in prices. The London market was notably weak and prices here were soft at the close. Jobbers quote Straits Pig in small lots at 28c. to 28¼c. per lb.

Copper.—There was little or nothing doing in this market this week. Business was practically at a standstill and prices were unchanged. The demand here is very light, but has increased in Europe, where prices are the lowest reached by Copper in two years. Small lots of Lake Ingot continue to be quoted at 17¼c. to 17½c. per lb. and Casting Copper at 16¾c. to 17c.

Sheet Copper.—The demand for Sheet Copper continues fairly liberal. Prices are firm and without change on the basis of 21c. per lb. for Sheet Copper from stock.

Pig Lead.—The metal is dull and unchanged, demand being of very ordinary volume and without feature of any kind. Small lots of American Pig are quoted at 4.60c. to 4.62½c. per lb. St. Louis market is quiet and rather weaker.

Spelter.—Dullness continues to mark this metal. The consumptive demand is tame and has been curtailed by the closing down, owing to the strike, of some of the large mills making Galvanized Sheets. Prices, while generally unchanged are inclined to weakness. Good Western brands, in a retail way, are quoted at 4.45c. to 4.50c. per lb. in New York.

Sheet Zinc.—The demand for Sheet Zinc is of about the usual proportions. Jobbers quote 600-lb. cask lots at 6¾c. per lb. and smaller quantities at 7¼c.

Antimony.—A fair demand is noted and prices remain unchanged. Cookson's, in small parcels, is quoted at 10½c. to 11c. per lb. and Hallett's at 8¾c. to 9½c.

Nickel—Is firm and unchanged. Small lots are quoted nominally at 60c. to 65c. per lb.

Aluminum.—A good demand at former prices is reported for this metal. No. 1 Ingot, guaranteed 99 per cent. pure, in small lots, is quoted at 37c. per lb. and 100-lb. lots 35c.

Tin Plates.—The unfavorable developments connected with the steel strike have brought about a nervous condition in the Tin Plate market and sent prices shooting upward with great rapidity. The demand from consumers for prompt deliveries is active and urgent, but comparatively few requirements of this kind can be satisfied, for supplies in jobbers' hands are dwindling down toward the vanishing point. Prices are entirely nominal, holders who have anything to offer being able to obtain almost any figures they choose to ask, within reason. All varieties of Bright and Roofing Plates are scarce, but light weight Coke Tins are particularly so. The latter are being sold at the same price as the heavier gauges. I C, 14 x 20, American Bessemer Coke Plates are selling as high as $7 to $7.25 per box, and even $8 is said to have been paid. Consumers who are anxious to cover their requirements are only too glad to pay these figures where they can have orders promptly filled. The situation has reached the famine stage, and the outlook is far from reassuring. Some importations of Welsh Plates reached New York this week, and others are understood to be on the way, but these will relieve the stringency to but a slight extent.
